

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

# PREFACE.

SCIENTIFIC PURSUITS have, in all ages, been considered of the greatest utility to mankind in general; and those individuals who have laboured successfully to elucidate the principles of Mathematics, or to simplify their application to the Practical affairs of life, have always been ranked among the most useful and honourable members of society.

Honourable indeed they must appear to all those who have learned to set due estimation on intellectual attainments; as, next to vital religion, they certainly constitute the true honour and dignity of man.

Riches and titles may be our legal possessions, by birth-right; however, in a meritorious point of view, they can scarcely be denominated our own; but the treasures of a well-stored mind can only be acquired by diligent study, and assiduous application; and are therefore our natural and unalienable property.

Mental acquirements not only enrich and dignify the possessor; but are productive of the most happy effects to the public in general. Like the common source of light, they shed beams of lustre on all around; and dispel the clouds of darkness, ignorance, and superstition on every side.

To the great improvements made in the Arts and Sciences we are indebted for most of the comforts and conveniences of life; and it may be affirmed, without fear of contradiction, that the advancement of no branch of

human knowledge has been attended with more beneficial consequences to the community, than the cultivation of the Mathematics.

Arithmetic and Geometry are the two grand pillars that support every other branch of science ; and to their Practical application, together with that of Mechanics, we may attribute the production of every machine now in use, from the stupendous and powerful steam engine, down to the elegant clock and watch.

By the assistance of Arithmetic, we are enabled to make every calculation that business or science requires ; and from the principles of Geometry we derive Practical Rules by which we can estimate the areas, solidities, and capacities of all kinds of Geometrical Figures.

The application of these Rules to finding the areas of figures, is called *Mensuration of Superficies* ; their application to finding the contents of bodies, is called *Mensuration of Solids* ; and when they are applied in finding the capacities of vessels, in ale and wine gallons, and malt bushels, the process is denominated *Gauging*.

This Art is of such general utility in the common affairs of life, that there are few persons who do not occasionally want its assistance ; and to Victuallers, Common Brewers, Maltsters, Distillers, Wine-Merchants, Spirit-Merchants, Soap-Makers, Starch-Makers, and Glass-Makers, it is of considerable moment ; for without its aid, they could not ascertain with accuracy the quantity of those articles which they manufacture.

There is, however, another class of persons to whom this Science is indispensably necessary ; namely, to those who intend to become Candidates for the Excise ; and as so large a portion of His Majesty's Revenue falls under the inspection of the Officers of the Excise, it is certainly of the first importance that they should be made fully acquainted with the Principles and Practice of Gauging, before they are appointed to discharge so momentous a duty as that with which they are intrusted.

Such being the utility of this Science, it is no wonder that so many persons have written on the Subject ; but it

is certainly matter of surprise, that of all the Treatises which have yet made their appearance, not one of them contains the Theory of Gauging, as it ought to be taught in Schools, united with the Practice, as adopted in the Excise.

We have Books of Arithmetic, Mensuration, Land-Surveying, Trigonometry, Navigation, Astronomy, Algebra, Fluxions, and Mechanics, which contain numerous Examples for the Exercise of the Learner; but not one Work on Gauging, that contains more than *One Example* in each Problem; and that Example wrought out at length.

Now, as Schools are the proper places in which the principles of every Science ought to be taught; why not have a Treatise on Gauging adapted for the use of Schools, and at the same time containing every necessary information relating to the Science, as it is *practised* by the Officers of the Excise?

Such are the reasons that have induced the Authors to write the following Work; and whatever may be its merits, it is certainly not a hasty production. It is nearly twenty years since one of its Authors first laid down the Plan, having found the want of such a Book in his avocation of instructing Youth; and both he and his Colleague have employed all their leisure moments for upwards of five years, in bringing the Plan to maturity.

The execution of the Work has cost them much more labour than they at first anticipated; and whoever reads it with attention, and solves all the Questions it contains, will not, they think, charge them with the crime of *book-making*, so much practised in the present day.

Having said thus much concerning the advantages of Mathematical Studies, and the motives that led to the production of the Work in question; we will now proceed to give some account of each of the Seven Parts into which it is divided.

**PART THE FIRST** contains a clear and concise view of *Vulgar and Decimal Fractions*; Square and Cube Roots;

with the application of the two latter to the Solution of various Mathematical Problems. A thorough knowledge of these subjects being indispensably necessary in all kinds of measurements; they form the most appropriate Introduction to a Treatise on Practical Gauging.

**PART THE SECOND** contains the description of the Sliding Rule; directions for finding any number upon it; and the application of the different lines to Multiplication, Division, the Rule of Three Direct and Inverse; and the Extraction of the Square and Cube Roots.

**PART THE THIRD** contains such Definitions, Problems, and Theorems in Geometry, as we conceived to be necessary in a Treatise on Practical Gauging. Those who desire to see the subject of Geometry more fully elucidated, are referred to the Elements of Simpson, Emerson, Bonnycastle, Keith, Playfair, and Leslie; to Simson's Euclid, Hutton's Course of Mathematics, and Reynard's Geometria Legitima. The last Work is well adapted to the capacities of Youth; and contains a number of Quæstiones Solvendæ, at the end of each Book; to which an excellent Key has lately been published by the Author.

**PART THE FOURTH** contains the Mensuration of Surfaces applied to Gauging. Besides giving Rules for finding the areas of regular and irregular figures; we have treated largely on the method of finding the areas of oval figures, which are not true ellipses, by means of equidistant ordinates. The Honourable Board of Commissioners have, by various General Letters, enjoined the Officers of the Excise to gauge all oval vessels by this method; and it certainly far excels every other, for finding the areas of curvilinear figures, when the nature of the curves cannot be determined.

In this Part we have adopted a method entirely different from that of any of our Predecessors; for by considering every plane figure as the base of some vessel whose sides are perpendicular, we have entered immediately on the Practical Part of Gauging, by multiplying the area of the base by the perpendicular depth; and thus we obtain the content of the vessel in ale and wine gallons, and malt bushels. This method has a decided advantage over that

of merely finding the areas of figures; as the Learner immediately perceives the real use of the Science.

PART THE FIFTH contains the Mensuration of Solids, applied to finding the capacities of vessels of every description. Besides giving Rules for determining the contents of all regular vessels, of a known form; we have given the method of finding the contents of circular vessels, with curved sides; when the nature of the curves cannot be ascertained. This we have done by means of equidistant parallel sections, founded on the method of equidistant ordinates. This Process is entirely new in a Book of Gauging; having never before appeared, except in Nesbit's 'Treatise on Practical Mensuration.' We have also given Rules for finding the contents of all cylindrical, pyramidal, and conical ungulas, that can possibly be formed, by placing, in various positions, vessels containing fluids. This has long been a *desideratum* in every Treatise on Gauging; and although these figures seldom occur in Practice, yet we are of opinion that every person who professes the art of Gauging, ought to be able to determine the capacity of any vessel or figure that can possibly be devised. This Part also contains One Hundred Miscellaneous Questions, which will serve to exercise the ability of the Learner; and prove his knowledge of the Theorems and Rules given in the former part of the Work.

PART THE SIXTH is divided into Seven Sections; and comprehends the whole System of Practical Gauging, as adopted in the Excise. The first Section contains the method of *gauging* and *fixing* Victuallers' Utensils; the second that of *gauging* and *inching* Common Brewers' Utensils; and the third comprehends the method of *gauging*, *inching*, and *ullaging* Casks. As no part of the Science is attended with such difficulty as that of finding the contents of close vessels; we have bestowed much attention upon this part of the subject; and to the method of obtaining the contents of casks, according to their several varieties, we have added those of finding their contents, by General Rules, without paying any regard to their varieties.

*Cask Gauging* by the Callipers, Bung Rod, and Head Rod, as practised by the Port Gaugers of the Excise and

Customs, is also given in this Section. In this Part of the Work we have been *ably* assisted by a Gentleman who has had considerable Practice in the Excise Department of Port Gauging, at Newcastle-upon-Tyne. He also very kindly furnished us with a Manuscript containing many *excellent* observations on the method of taking the dimensions, making the allowances, casting the contents, &c. &c. For these favours we offer him our most unfeigned thanks.

The fourth Section contains the method of *gauging* and *fixing* Maltsters' Utensils; and the fifth that of *gauging* and *inching* the Utensils of Distillers. The sixth Section comprehends the method of *gauging* and *inching* the Utensils of Soap-Makers, Starch-Makers, and Glass-Makers.

The seventh Section contains the Method of finding the areas and contents of vessels in Irish malt bushels and liquid gallons; and of reducing Irish to English, and English to Irish measure; thus the Work is adapted for Ireland, as well as for England and Scotland. This Section also contains a Table of the Specific Gravities of bodies; the method of finding the magnitude of a body from its weight, or the weight of a body from its magnitude; and likewise the process of determining the tonnage of Ships, according to the Parliamentary Rules.

PART THE SEVENTH is divided into three Sections. The first contains a Table of Ale Areas; the second a Table of Wine Areas; and the third a Table for reducing Ale Gallons to Victuallers' Barrels.

Besides the regular subjects enumerated in the Table of Contents, the Work is interspersed with numerous Notes, Remarks, and Observations, which will tend greatly to elucidate the Subject. The leading features of these Remarks we will just notice in a cursory manner. Part the Sixth contains copious directions for taking the dimensions of all kinds of vessels that can possibly be met with in the Practice of Gauging. This is of the greatest importance; for it is evident that if the dimensions be improperly taken, the results must always be incorrect; notwithstanding the greatest accuracy may be used in finding the areas and contents.

Every possible attention has been paid to the method of gauging and fixing the Utensils of Victuallers; and to gauging and inching those of Common Brewers; and numerous Examples have been given to illustrate the method of entering the dimensions and areas; and forming the Table Books, as practised by Officers of the Excise. On Cask Gauging we have made several Remarks, Observations, and Comparisons, which will tend to elucidate that subject; and point out the impropriety of gauging all casks as belonging to the first variety.

Malt Gauging is treated of very extensively; and every information has been given, that we thought necessary on that subject. The method of gauging Stills, and Still-Heads is rendered as simple as possible; and that of gauging and inching oval Wash-backs, and Jack-backs, by means of equidistant ordinates, is treated in a clear and perspicuous manner. The methods of gauging Soap and Glass have never before appeared in any Work on this subject; and will therefore be found very acceptable to those who are concerned in the manufacturing of these articles.

In finding the areas and contents of vessels, we have not only used the Pen, and the Sliding Rule; but also the Tables of Ale and Wine Areas given in Part the Seventh. As the Sliding Rule is much used by Officers of the Excise, we have given clear and perspicuous Rules for its application, whenever it could be introduced with success. The Tables of Ale and Wine Areas we have taken from Mr. Moss's Gauging; they being more correct than any other that have fallen under our notice. They generally give the areas of circles rather more than the Rule by the Pen; but sufficiently correct for every Purpose of Practical Gauging.

The Questions given in each Problem, for the Exercise of the Learner, form one of the most prominent features of the Work; and completely distinguish it from all others on the same subject. These Questions will be found of infinite service in Schools; and are what Teachers have long desired; for it is impossible to make young persons comprehend any subject properly, without giving them Line upon Line, and Precept upon Precept.

Notwithstanding a person may possess the most brilliant talents ; that he may comprehend general arts and sciences in all their ramifications ; and that long practice may have made him familiar with particular subjects ; yet it will readily be admitted that he will find some difficulty in retaining every *minutia* relating even to those sciences with which he is most intimately connected. Taking these things into consideration, we are persuaded that the following Work will be found useful, not only to Learners, but also to those persons who are already acquainted with the subject of Gauging ; and we hope it is executed in such a manner, and treats so extensively of the Science, in all its Departments, that even Experienced Officers of the Excise and Customs will not find it unworthy of their Notice, as a Book of General Reference.

Having taken a survey of the subsequent Work, and made such introductory observations as we thought necessary ; it now only remains for us to solicit the indulgence of the Public, for any errors that may have escaped our notice.

As the Work is entirely new, we do not expect that it will be found quite free from imperfections ; however, we can assure our Readers, that neither labour nor pains have been spared in order to produce such a Treatise on Practical Gauging, as may be found worthy of General Patronage.

A. NESBIT.  
W. LITTLE.

Bradford, Yorkshire, }  
June, 1822.

P. S. A Key to the Practical Gauging is in the Press, and will be published in a few Weeks.

# CONTENTS.

## PART I.

### *Vulgar and Decimal Fractions, and Square and Cube Roots.*

	Page.
DEFINITIONS of Vulgar and Decimal Fractions .....	1
Addition of Decimals .....	3
Subtraction of Decimals.....	4
Multiplication of Decimals .....	5
Reduction of Decimals .....	7
Rule of Three in Decimals .....	10
Square Root.....	14
Square Root applied to the Solution of Mathematical Problems	16
To find a mean proportional between two given numbers .....	16
To find the side of a square, equal in area to any given superficies	16
To find the diameter of a circle, when the area is given .....	17
To find the hypotenuse of a right-angled triangle, when the base and perpendicular are given .....	17
Given the hypotenuse of a right-angled triangle, and either of the legs, to find the other leg .....	18
Given the head and bung diameters, and length of a cask, to find the diagonal .....	18
Given the diagonal and diameters of a cask, to find its length...	19
Cube Root .....	19
Cube Root applied to the Solution of Mathematical Problems ...	21
To find the side of a cubical vessel, when the content is given	21
Given the dimensions of any vessel, to find the dimensions of a similar vessel, the content of which shall be in any given ratio to that of the given vessel .....	22

Page.

Given the dimensions and content of any vessel, to find the dimensions of a similar vessel of a given content .....	23
---	----

## PART II.

*The Description and Use of the Sliding Rule.*

The description of the sliding rule.....	24
To estimate the value of the divisions on the sliding rule.....	28
The use of the sliding rule .....	31
Multiplication by the sliding rule .....	31
Division by the sliding rule.....	33
Rule of Three .....	34
Inverse Proportion .. ..	35
To reduce a vulgar fraction to a decimal .....	35
Given a divisor to find a multiplier .....	36
Given a multiplier to find a divisor.....	36
To square any number.....	37
To extract the square root of any number.....	37
To find a mean proportional between two numbers .....	38
To cube any number .....	38
To extract the cube root of any number.....	39

## PART III.

*Definitions, Problems, and Theorems in Geometry.*

Geometrical Definitions .....	39
Geometrical Problems .....	47
To bisect a given line .....	47
To bisect a given angle .....	48
To draw a line parallel to a given line .....	48
To erect a perpendicular upon a given line .....	49
To let fall a perpendicular from a given point .....	50
To find the centre of a given circle .....	50
To construct a triangle with three given lines .....	51
Given the base and perpendicular to construct a triangle .....	51
To describe a square whose side shall be equal to a given line...	52

## Page.

To describe a rectangle whose length and breadth shall be equal to two given lines .....	52
To construct a regular rhombus.....	53
To construct an irregular rhombus.....	53
To construct a regular rhomboid .....	54
To construct an irregular rhomboid .....	54
To construct an ellipse.....	55
To construct a regular pentagon.....	56
To construct a regular hexagon .....	56
To construct a regular octagon .....	57
In a given triangle, to inscribe a circle .....	57
About a given triangle, to circumscribe a circle .....	58
To make a triangle equal to a given trapezium.. ..	58
To make a right angle by the line of chords on the plane scale	59
To make an acute angle .....	59
To make an obtuse angle.....	59
To find the number of degrees contained in any given angle ...	60
To make a regular polygon of any number of sides .....	60
In a given circle, to inscribe a regular polygon.....	61
To raise a perpendicular by a scale of equal parts.....	61
To find the centre of a given ellipse .....	62
To determine whether a given oval figure be greater or less than a true ellipse.....	63
Geometrical Problems for the exercise of the Learner .....	64
Geometrical Theorems .....	65

## PART IV.

*Mensurations of Superficies applied to Gauging.*

Preliminary Observations .....	71
Tables of ale and beer measure, 36 gallons to a barrel.....	72
Tables of ale and beer measure, 34 gallons to a barrel.....	73
Tables of ale and beer measure, 32 gallons to a barrel.....	74
Tables of wine and spirit measure .....	76
Tables of corn or dry measure.....	77
Tables of avoirdupois weight .....	78

	Page.
The method of finding multipliers, divisors, and gauge-points...	78
To find multipliers for squares .....	80
To find multipliers for circles .....	81
To find divisors for circles .....	81
To find gauge-points for squares .....	82
To find gauge-points for circles .....	82
A Table of multipliers, divisors, and gauge-points, for squares and circles .....	83
Problems in Practical Gauging .....	84
To find the area of a square in ale, wine, and malt-tun gallons, and malt bushels .....	84
To find the area of a rectangle .....	90
To find the area of a rhombus or rhomboides .....	94
To find the area of a triangle, when the base and perpendicular are given .....	96
To find the area of a triangle, when the sides are given .....	99
To find the area of a trapezium .....	101
To find the area of a trapezoid .....	104
To find the area of an irregular polygon .....	107
To find the area of a regular polygon .....	111
To find the area of a regular polygon, when the side only is given .....	113
To find the diameter and circumference of a circle .....	115
To find the length of the arc of a circle .....	117
To find the area of a circle .....	119
To find the area of the sector of a circle .....	123
To find the area of the segment of a circle .....	125
To find the area of an ellipse .....	128
To find the area of an elliptical segment .....	130
To find the area of a parabola .....	131
To find the area of compound figures ... ..	133
To find the area of any curvilinear figure, by means of equi- distant ordinates .....	135
A Table of circular segments .....	146

## PART V.

*Mensuration of Solids applied to Gauging.*

	Page
Definitions of solids .....	154
Definitions of the conic sections .....	159
General properties of the conic sections .....	163
Properties of the ellipse .....	163
Properties of the parabola.....	163
Properties of the hyperbola ... ..	164
Problems in Practical Gauging.....	165
To find the content of a cubical vessel, in ale and wine gallons, and malt bushels .....	165
To find the content of a vessel in the form of a parallelopipedon	169
To find the content of a vessel in the form of a prism.....	172
To find the content of a vessel in the form of a cylinder .....	175
To find the content of a vessel in the form of a pyramid .....	177
To find the content of a vessel in the form of the frustum of a pyramid.....	181
To find the content of a vessel in the form of a cone ... ..	184
To find the content of a vessel in the form of the frustum of a cone .....	186
To find the content of a vessel in the form of a prismoid .....	190
To find the content of a vessel in the form of a sphere or globe	194
To find the content of a vessel in the form of the segment of a sphere.....	196
To find the content of a vessel in the form of the frustum or zone of a sphere .....	199
To find the content of a vessel in the form of a prolate spheroid	201
To find the content of a vessel in the form of the middle frus- tum of a prolate spheroid .....	203
To find the content of a vessel in the form of a parabolic spindle	205
To find the content of a vessel in the form of the middle frus- tum of a parabolic spindle .....	207
To find the content of a vessel in the form of a parabolic conoid	209
To find the content of a vessel in the form of the frustum of a parabolic conoid .....	211

	Page.
To find the content of a circular vessel when its sides are a little curved .....	214
To find the content of a circular vessel when its sides are much curved, by taking five diameters at equal distances from each other .....	215
To find the content of a circular vessel, when its sides are very much curved, by taking a competent number of equidistant, parallel sections .....	217
To find the content of a cylindrical ungula, when the liquor intersects the sides of the vessel, in an oblique direction	222
To find the content of a cylindrical ungula, when its base is less than a semi-circle ..	224
To find the content of a cylindrical ungula, when its base is a semi-circle .....	226
To find the content of a cylindrical ungula, when its base is greater than a semi-circle .....	227
To find the content of a pyramidal or prismoidal ungula, in the form of a cuneus or wedge.....	229
To find the content of a conical ungula, when the liquor just covers the bottom of a conical vessel, placed upon its greater base .....	233
To find the content of a conical ungula, when the liquor just covers the bottom of a conical vessel, placed upon its less base .....	235
To find the content of a conical ungula, when the liquor intersects the sides of the vessel, in an oblique direction ...	236
To find the content of an elliptic ungula, when the liquor covers only part of the bottom of a conical vessel, placed upon its greater base .	238
To find the content of an elliptic ungula, when the liquor covers only part of the bottom of a conical vessel, placed upon its less base .....	241
To find the content of a parabolic ungula .....	243
To find the content of a hyperbolic ungula .....	245
To find the area of the hyperbolic section formed by the surface of the liquor .....	245

	Page.
To find the transverse and conjugate diameters of the hyperbolic section .....	246
Miscellaneous Examples in the Mensuration of Superficies and Solids, applied to Gauging .....	249

## PART VI.

### PRACTICAL GAUGING, IN ALL ITS DEPARTMENTS, AS IT IS CONDUCTED BY HIS MAJESTY'S OFFICERS OF THE EXCHE.

#### SECTION I.

#### *The Method of Gauging and Fixing Victuallers' Utensils.*

To gauge and fix a mash-tun, in the form of the frustum of a cone .....	262
To gauge and fix a mash-tun, in the form of the frustum of a square pyramid .....	267
To gauge and fix a copper with a falling crown .....	270
To gauge and fix an under-back .....	276
To gauge and fix a rectangular back or cooler .....	279
To gauge and fix a guile-tun, in the form of the frustum of a cone ..	283
To gauge and fix a circular guile-tun, with curved sides .....	287
To gauge and fix a guile-tun in the form of the frustum of an elliptical cone .....	290
To gauge and fix a guile-tun with an elliptical base and a circular top, generally called a cylindroid .....	293
To gauge and fix a guile-tun in the form of the frustum of a square pyramid .....	295
To gauge and fix a guile-tun in the form of the frustum of a rectangular pyramid, or a prismoid .....	298
To gauge by tube of various forms ..	301
To deduct the heat out of Victuallers' warm worts .....	306
Given the top and bottom diameters, and the perpendicular	

	Page.
depth of a vessel in the form of the frustum of a cone, to determine the intermediate diameters, at any as- signed depth .....	310
Given the top and bottom diameters, and the perpendicular depth of a vessel, in the form of the frustum of a semi- sphere, to determine the intermediate diameter, at any assigned depth from the top of the vessel .....	311
Given the top and bottom diameters, and the perpendicular depth of a vessel, in the form of the frustum of a semi- sphere, to determine the intermediate diameter, at any assigned depth from the bottom of the vessel .....	315
Given the top diameter and perpendicular depth of a vessel in the form of the less segment of a sphere, to determine the intermediate diameter, at any assigned depth from the top of the vessel .....	315
Given the top diameter and perpendicular depth of a vessel in the form of the less segment of a sphere, to determine the intermediate diameter, at any assigned depth from the bottom of the vessel .....	316
A Specimen of a Dimension Book for Victuallers' Utensils ....	317

## SECTION II.

### *The Method of Gauging and Inching Common Brewers' Utensils.*

To gauge and inch a mash-tun in the form of the frustum of a cone .....	319
To gauge and inch a copper with a rising crown .....	326
To gauge and inch a copper with a falling crown .....	337
To gauge and inch a copper-back ..	339
To gauge and inch an under-back in the form of a cylinder ...	342
To gauge and inch a rectangular hop-back .....	345
To gauge and tenth a back or cooler .....	348
To gauge and inch a guile-tun in the form of a parallelopipedon	353
To gauge and inch a guile-tun in the form of the frustum of a cone, and make an allowance for the fall or drip ... ..	356

	Page.
To gauge and inch a circular guile-tun with curved sides, and make an allowance for the fall or drip.....	362
To gauge and inch an elliptical guile-tun, and make an allowance for the fall or drip .....	365
To deduct the heat from Common Brewers' warm wort .. ...	368

### SECTION III.

#### *The Method of Gauging, Ullaging, and Inching Casks.*

Preliminary Observations.....	370
To take the dimensions of a standing cask, when it is full of liquor .....	372
To take the dimensions of a lying cask, when it is full of liquor	374
To gauge and fix a cask of the first variety.....	375
To gauge and fix a cask of the second variety.....	377
To gauge and fix a cask of the third variety .....	380
To gauge and fix a cask of the fourth variety .....	382
To find the content of a cask by the Diagonal Rod.....	385
Description of the Diagonal Rod and Brannan's Rule.....	385
To find the contents of casks in general, from the head diameter, bung diameter, and length.....	388

## AN EXPLANATION OF THE

### *Principal Mathematical Characters.*

The sign or character  $=$  (called equality) denotes that the respective quantities, between which it is placed, are equal; as 282 cubic inches  $=$  8 pints  $=$  quarts  $=$  1 ale gallon.

The sign  $+$  (called *plus*, or more) signifies that the numbers between which it is placed, are to be added together; as  $9 + 6$  (read 9 *plus* 6)  $=$  15. Geometrical lines are generally represented by capital letters; when  $AB + CD$ , signifies that the line AB is to be added to the line CD.

The sign  $-$  (called *minus*, or less) denotes that the quantity which it precedes, is to be subtracted; as  $15 - 6$  (read 15 *minus* 6)  $=$  9. In geometrical lines also,  $AB - CD$ , signifies that the line CD is to be subtracted from the line AB.

The sign  $\times$  denotes that the numbers, between which it is placed, are to be multiplied together ;  $5 \times 3$  (read 5 multiplied by 3)  $= 15$ .

The sign  $\div$  signifies division ; as  $15 \div 3$  (read divided by 3)  $= 5$ . Numbers placed like a vulgar fraction, also denote division ; the upper number being the dividend, and the lower the divisor ; as  $\frac{15}{3} = 5$ .

The signs  $:$   $::$   $:$  (called proportionals) denote proportionality ; as  $2 : 5 :: 6 : 15$ , signifying, that the number 2 bears the same proportion to 5, as 6 do to 15 ; or, in other words, as 2 is to 5, so is 6 to 15.

The sign  $\overline{\hspace{1cm}}$  (called *vinculum*) is used to connect several quantities together ; as  $\overline{9 + 3} - 6 \div 2 = \overline{12 - 6} \div 2 = 6 \div 2 = 3$ .

The sign  $^2$ , placed above a quantity, represents the square of that quantity ; as  $\overline{5 + 3}^2 = 8^2 = 8 \times 8 = 64$ .

The sign  $^3$ , placed above a quantity, denotes the cube of that quantity ; as  $\overline{9 + 3}^3 - 8^3 = \overline{12 - 8}^3 = 4^3 = 4 \times 4 \times 4 = 64$ .

The sign  $\sqrt{\hspace{1cm}}$  or  $\sqrt[2]{\hspace{1cm}}$ , placed before a quantity, denotes the square root of that quantity : as  $\sqrt{9 \times 4} = \sqrt{36} = 6$ .

The sign  $\sqrt[3]{\hspace{1cm}}$ , placed before a quantity, represents the cube root of that quantity ; as  $\sqrt[3]{6 \times 4 \times 3} - 8 = \sqrt[3]{24 \times 3} - 8 = \sqrt[3]{72 - 8} = \sqrt[3]{64} = 4$ .

# TREATISE

ON

## PRACTICAL GAUGING.

---

**GAUGING** is the Art of finding the Capacities or Contents of all sorts of Vessels used by Maltsters, Brewers, Distillers, Wine Merchants, Victuallers, &c. &c.; such as Cisterns, Couches, Coppers, Coolers, Tuns, Vats, Stills, &c. &c.

Now, as all Instruments used in Gauging are decimally divided; and as the Dimensions of all Vessels are taken in Inches and Tenths, it is evident that the most appropriate Introduction to a Treatise on Practical Gauging, must be a clear and concise View of Decimal Fractions.

---

### PART I.

*Algar and Decimal Fractions, and Square and Cube Roots.*

---

### FRACTIONS.

#### DEFINITIONS.

1. A **VULGAR FRACTION** is a broken number, represented by two figures placed one above the other, with a line drawn between them.
2. The **upper figure** of a fraction is called the *numerator*; and the **lower figure** the *denominator*.
3. The **denominator** shows into how many equal parts

the whole, or unity, is supposed to be divided; and the numerator, the number of those parts taken.

4. When the numerator is less than the denominator, the fraction is less than unity, and is called a *proper fraction*; as  $\frac{1}{4}$  one-quarter;  $\frac{1}{2}$  one-half;  $\frac{3}{4}$  three-quarters;  $\frac{6}{8}$  six-eighths, &c.

5. When the numerator is greater than the denominator, the fraction is greater than unity, and is called an *improper fraction*; as  $\frac{3}{2}$  three-seconds;  $\frac{5}{3}$  five-thirds;  $\frac{12}{9}$  twelve-ninths, &c.

6. A *simple fraction* is that which is expressed singly, or without any reference to others, as  $\frac{1}{4}$ ,  $\frac{6}{8}$ , &c.

7. A *compound fraction* is the fraction of a fraction, as  $\frac{1}{2}$  of  $\frac{3}{4}$ ;  $\frac{4}{5}$  of  $\frac{5}{6}$ , &c.

8. The *common measure* of a fraction is a number that will divide both the numerator and denominator without a remainder.

9. A *decimal fraction*, is that which has 10, on some power of 10, as 100, 1000, &c. for its denominator; and instead of *writing* the denominator under the numerator, it is *expressed* by pointing off, from the right of the numerator, as many figures as there are cyphers in the denominator; thus,  $\frac{2}{10}$ ,  $\frac{24}{100}$ ,  $\frac{364}{1000}$ ,  $\frac{5648}{10000}$ , are respectively equal to .2, .24, .364, 5.648.

10. Cyphers placed on the right of a decimal make no alteration in its value; thus, .2, .20, .200, or  $\frac{2}{10}$ ,  $\frac{20}{100}$ ,  $\frac{200}{1000}$ , are all equal to each other; but if they be placed on the left of the decimal, they decrease its value in a ten-fold proportion; thus, .2, .02, .002 are respectively equal to  $\frac{2}{10}$ ,  $\frac{2}{100}$ ,  $\frac{2}{1000}$ .

11. Decimals have the same properties as whole numbers, and are subject to the same rules; for in the notation of both, the values of the figures *decrease* in a ten-fold proportion from the left to the right.

12. The first figure of a decimal fraction, or that next the decimal *point*, is called tenths, the second hundredths, the third thousandths, &c.; thus, the fraction .234 is read, 2 tenths, 3 hundredths, and 4 thousandths of a unit. (See the following table.)

13. A *mixed number* is composed of a whole number and a decimal, which are separated from each other by a point; thus 25.6 are equal to 25  $\frac{6}{10}$ .

14. *Compound numbers* are such as consist of several denominations, as pounds, shillings, and pence ; hundred weights, quarters, and pounds, &c.

TABLE.

Whole numbers.					Decimal parts.				
7 Millions.	6 Hundreds of thousands.	5 Tens of thousands.	4 Thousands.	3 Hundreds.	2 Tens.	1 Units.	.2 Tenths.	3 Hundredths.	4 Thousandths.
								5 Ten thousandths.	6 Hundred thousandths.
									7 Millionths.

*Note.* Decimals are only vulgar fractions of a particular description, and were introduced in order to lessen the trouble which, in many cases, attends the use of the latter. They are much used in the *practical affairs of life*, particularly in Mensuration and weighing.

ADDITION OF DECIMALS.

RULE.

Place the figures in such a manner that those of the same denomination may stand under each other ; add them together as in whole numbers, and point off as many figures, for decimals, as are equal to the greatest number of decimal places in any of the given numbers.

*Note.* It has already been observed, that decimals and whole numbers are both subject to the same rules ; but in all calculations by the former, great care must be taken to point off the proper number of decimal places in the results, or the truth of the operations will be completely destroyed.

EXAMPLES.

1. What is the sum of  $54.646 + 3.95 + 46.8905 + 968.2027.0264 + .2064 + 2.0463 + 5.646$  ?

$$\begin{array}{r}
 54.646 \\
 3.95 \\
 46.3905 \\
 968.202 \\
 7.0264 \\
 .2064 \\
 2.0463 \\
 5.646 \\
 \hline
 1088.1136 \text{ Ans.} \\
 \hline
 \end{array}$$

2. Find the sum of  $367.60 + 4678.3609 + 869.563 + .2003 + 7.5964 + 42.67$ . *Ans. 5965.9906.*
3. Add  $53.7 + 2943 + 1.2 + 2.0073 + 1.47 + 637$ . *Ans. 3638.3773.*
4. Required the sum of  $124.1 + .3492 + 84.02 + 6.349 + .00879 + 71.2$ . *Ans. 286.02699.*

## SUBTRACTION.

### RULE.

Place the figures of the same denomination under each other; then, beginning at the right-hand subtract as in whole numbers, and point off the decimals as in addition.

### EXAMPLES.

1. What is the difference between 52.73 and 2.676?

$$\begin{array}{r}
 52.73 \\
 2.676 \\
 \hline
 50.054 \text{ Ans.} \\
 \hline
 \end{array}$$

2. From 2.18 take .814. *Ans. 1.366.*
3. From .794 take .0981. *Ans. .6959.*
4. What is the difference between .0943 and .09281? *Ans. .00149.*
5. Required the difference between 374.901 and 68.14. *Ans. 306.761.*

## MULTIPLICATION.

## RULE.

Place the figures under each other, and multiply them together, as in whole numbers; and point off as many decimal places in the product as there are in the multiplier and the multiplicand together.

*Note 1.* When there are not so many figures in the product as there are decimals in the multiplier and multiplicand together, cyphers must be annexed to the *left* of the product, that the decimal places may be properly represented.

2. When a decimal is to be multiplied by 10, 100, 1000, &c., it is only necessary to remove the decimal point so many places to the *right*, as there are cyphers in the multiplier; thus,  $4.27 \times 10 = 42.7$ ; and  $379 \times 100 = 37.9$ .

3. If a decimal be multiplied by a decimal, the product will be less than either the multiplier or multiplicand; and if a whole or a mixed number be multiplied by a decimal, the product will always be less than the multiplicand.

## EXAMPLES.

1. What is the product of 24.73 multiplied by 7.325?

$$\begin{array}{r}
 24.73 \\
 7.325 \\
 \hline
 12365 \\
 4946 \\
 7419 \\
 17311 \\
 \hline
 181.14725 \text{ Ans.}
 \end{array}$$

2. Multiply .00741 by .00054. *Ans.* .0000040014.

3. Multiply .3141 by 20.5. *Ans.* 6.43905.

4. Multiply .35426 by .025. *Ans.* .00885650.

5. What is the product of 9268.456 multiplied by .389? *Ans.* 7844719.205384.

## DIVISION.

## RULE.

Divide as in whole numbers, and point off from the *left-hand* of the quotient, as many figures for decimals, as the decimal places in the dividend exceed those in the divisor.

*Note 1.* When the figures in the quotient are too few to make up the proper number of decimals required by the rule, the defect must be supplied by prefixing cyphers to the left of the quotient.

2. When the dividend does not contain as many decimals as the divisor, cyphers must be placed on the right of the dividend, until they are made equal, previously to beginning the operation; and the quotient, to that extent, will be a whole number.

3. If there be a remainder after division, you may continue the quotient to any extent that may be thought necessary, by subjoining a cypher continually to the last remainder.

4. When it is required to divide a decimal by 10, 100, 1000, &c., remove the decimal point so many places to the left as there are cyphers in the divisor; thus,  $36.4 \div 10 = 3.64$ ; and  $.5864 \div 100 = .005864$ .

5. If a decimal be divided by a decimal, the quotient will be greater than either the divisor or dividend; and if a whole, or a mixed number, be divided by a decimal, the quotient will be greater than the dividend; but if a decimal be divided by a whole, or a mixed number, the quotient will be less than the dividend.

#### EXAMPLES.

1. Divide .2843701 by .147.

.147).2843701(1.9344 *Ans.*

$$\begin{array}{r}
 147 \\
 \hline
 1378 \\
 1323 \\
 \hline
 507 \\
 441 \\
 \hline
 660 \\
 588 \\
 \hline
 721 \\
 588 \\
 \hline
 133 \text{ remainder.} \\
 \hline
 \hline
 \end{array}$$

2. What is the quotient of 741 divided by .325?

*Ans.* 2280.

3. Divide 839 by 5.2.

*Ans.* 161.3461.

4. What is the quotient of .074 divided by 36?

*Ans.* .00205.

5. Divide 48324.36 by 24.05.

*Ans.* 2009.32.

6. Divide 5.6569 by 265.686.

*Ans.* .02203.

## REDUCTION.

## CASE I.

*To reduce a vulgar fraction to a decimal of the same value.*

## RULE.

Place cyphers, at pleasure, on the right of the numerator, as decimals; then divide by the denominator, and the quotient will be the decimal required.

*Note 1.* A compound fraction may be reduced to a simple one, by multiplying all the numerators together for a new numerator, and all the denominators together for a new denominator; thus,  $\frac{1}{2}$  of  $\frac{1}{3}$  =  $\frac{1}{6}$ .

2. An improper fraction may be reduced to a mixed number, by dividing the numerator by the denominator; thus,  $29\frac{1}{2}$  =  $27\frac{1}{2}$ .

3. A mixed number may be reduced to an improper fraction, by multiplying the whole number by the denominator of the fraction, adding the numerator to the product; and placing the sum over the denominator; thus,  $28\frac{1}{5}$  =  $\frac{28 \times 5 + 1}{5} = \frac{141}{5}$ .

4. A whole number may be expressed like a fraction, by putting 1 for its denominator.

## EXAMPLES.

1. Reduce  $\frac{1}{4}$  to a decimal.

$$\begin{array}{r} 4 \overline{)1.00} \\ \underline{.25} \text{ Ans.} \end{array}$$

2. Reduce  $\frac{1}{2}$  to a decimal.

*Ans.* .5.

3. Reduce  $\frac{3}{4}$  to a decimal.

*Ans.* .75.

4. What is the decimal of  $\frac{3}{8}$ ?

*Ans.* .375.

5. Reduce  $\frac{1}{2}$  to an equivalent decimal.

*Ans.* .72.

6. What is the decimal of  $\frac{3}{4}$ ?

*Ans.* .631578.

7. Let  $\frac{5}{7}$  be reduced to a decimal.

*Ans.* .048476.

8. Express  $\frac{4}{11}$  by decimals.

*Ans.* .333333.

9. What is the decimal of  $\frac{5}{6}$ ?

*Ans.* .0813631.

10. Let  $\frac{5869}{83387}$  be expressed in decimals.

*Ans.* .687502.

11. Reduce  $\frac{2}{3}$  of  $\frac{1}{2}$  of  $\frac{1}{3}$  to a decimal.

*Ans.* .277.

12. Reduce  $\frac{1}{8}$  of  $\frac{2}{3}$  of  $\frac{1}{4}$  to a decimal.

*Ans.* .9533.

## CASE II.

*To reduce numbers of different denominations, as money, weights, measures, &c. to their equivalent decimal value.*

## RULE.

Reduce the given numbers to the lowest denomination mentioned, for a dividend; also reduce the integer to the same denomination, for a divisor; then annex cyphers to the dividend, divide as in whole numbers, and the quotient will be the decimal required.

*Note.* Tables of Ale and Beer Measure, Wine Measure, Dry Measure, and Avoirdupois Weight, may be seen in Part IV.

## EXAMPLES.

1. Reduce 15s. 6 $\frac{1}{4}$ d. to the decimal of a pound sterling.

$$\begin{array}{r}
 \begin{array}{cc}
 s. & d. \\
 15. & 6\frac{1}{4} \\
 12 & \\
 \hline
 186 & 
 \end{array} \\
 \begin{array}{r}
 \text{£. Far. } 4 \\
 1=960 \overline{)747.000000} (.778125 \text{ Ans.} \\
 \underline{6720} \\
 7500 \\
 \underline{6720} \\
 7800 \\
 \underline{7680} \\
 1200 \\
 \underline{960} \\
 2400 \\
 \underline{1920} \\
 4800 \\
 \underline{4800} \\
 \hline
 \hline
 \end{array}
 \end{array}$$

2. Reduce 10s. 9 $\frac{1}{4}$ d. to the decimal of a pound.

*Ans.* .540625.

3. Reduce 9s. 3 $\frac{1}{4}$ d. to the decimal of a pound.

*Ans.* .4635416.

4. Reduce  $10\frac{1}{2}d.$  to the decimal of a shilling. *Ans.* .875.
5. Reduce  $19s. 11\frac{3}{4}d.$  to the decimal of a pound. *Ans.* .9989583.
6. Reduce 2 pints of wine to the decimal of a gallon. *Ans.* .25.
7. Reduce 189 gallons of wine to the decimal of a tun. *Ans.* .75.
8. Reduce 8 gallons of ale to the decimal of a firkin. *Ans.* .888888.
9. Reduce 56 gallons of beer to the decimal of a butt. *Ans.* .518518.
10. Reduce 3 pecks of malt to the decimal of a bushel. *Ans.* .75.
11. Reduce 4 quarters, 5 bushels, and 2 pecks of barley, to the decimal of a last. *Ans.* .46875.
12. Reduce 12 ounces avoirdupois, to the decimal of a pound. *Ans.* .75.
13. Reduce 22 pounds, 9 ounces of candles, to the decimal of a quarter. *Ans.* .8058035.
14. Reduce 3 quarters, 14 pounds, and 8 ounces of flax, to the decimal of a hundred weight. *Ans.* .8794.
15. Reduce 15 hundred weight, 2 quarters, and 21 pounds of soap to the decimal of a ton. *Ans.* .784375.

### CASE III.

*Find the value of a decimal fraction in the known parts of an integer.*

#### RULE.

Multiply the given decimal by the number of parts contained in the next inferior denomination; and, from the right of the product, point off as many figures as there are places in the given decimal. Multiply the decimals thus pointed off, by the parts in the next less denomination; reserving as many places to the right, as before. Proceed in this manner through all the denominations to the last; then the several figures on the left of the decimal points, will be the answer required.

#### EXAMPLES.

1. What is the value of .7362 of a pound sterling?

$$\begin{array}{r}
 .7362 \\
 \times 20 \\
 \hline
 14.7240 \\
 \times 12 \\
 \hline
 8.6880 \\
 \times 4 \\
 \hline
 2.7520 \\
 \hline
 \hline
 \end{array}$$

*Ans.* 14s. 8½d.

2. What is the value of .8649 of a shilling? *Ans.* 10¼d.
3. Find the value of .92846 of a pound. *Ans.* 18s. 6¾d.
4. Required the value of .8694 of a hogshead of wine.  
*Ans.* 54 gal. 3 qt.
5. What is the value of .73828 of a barrel of beer?  
*Ans.* 26 gal. 2 qt.
6. Required the value of .5694 of a quarter of malt.  
*Ans.* 4 bush. 2 pk.
7. What is the value of .68328 of a last of barley?  
*Ans.* 6 qr. 6 bush. 2½ pk.
8. Find the value of .9326 of a hundred weight of tallow.  
*Ans.* 3 qr. 20 lb. 7 oz.

## RULE OF THREE.

### RULE.

State the question as in the common Rule of Three ; reduce the inferior denominations of such of the terms as are compound, to the decimal parts of their integer ; multiply the second and third terms of the proportion together, and divide the product by the first term, and the quotient will be the answer required, which must, if necessary, be reduced to its integral value.

*Note 1.* In solving questions in the Rule of Three, proper attention must be paid to the rules given in multiplication and division, for pointing off the decimals.

2. As Arithmeticians differ in their opinions with regard to the best method of stating questions in the Rule of Three, we shall here give both Rules ; and the learner may use that of which he most approves.

## RULE I.

Consider which of the three given terms is of the same kind as answer, or number sought, and put it down as the third term of the proportion.

Then, if it appears, from the nature of the question, that the answer will be greater than this number, make the greater of the other numbers the second term, and the less the first; but if it will be less, make the less number the second term, and the greater the first.

Reduce the first and second terms of the proportion to the same denomination, and the third to the lowest denomination mentioned.

Multiply the second and third terms together, and divide the product by the first term; and the quotient will be the answer, in the denomination to which the third term was reduced.

2. The answer on the fourth term, must, when necessary, be brought again, to the highest denomination of which it admits, in order that it may be expressed in a proper form.

## RULE II.

Put down that number which is of the same name as the answer, for the second term in the proportion.

Then, from the nature of the question, whether the answer will be greater or less than this number.

If it appears that it will be greater, make the less of the two remaining numbers, the first term, and the greater the third; but if the answer will be less than the second term, make the greater number the first term, and the less the third.

Reduce the first and third terms of the proportion to the same denomination, and the second to the lowest denomination mentioned.

Multiply the second and third terms together, divide the product by the first term; and the quotient will be the answer, in the same denomination as the second term.

3. 1. In stating questions in the Rule of Three, the word *As*, is usually placed before the first term, and the signs of proportion before each of the other terms, thus, *As* 4 lb. : 12 lb. :: 5s. : 15s. by the first Rule.

Or,

*As* 4 lb. : 5s. :: 12 lb. : 15s. by the second Rule.

Some persons object to the second Rule, on this ground, that no relation whatever can subsist between 4 lb. and 5s. or between 12 lb. and 15s. The first Rule is, in our opinion, more scientific; but we are inclined to think, that the second will be more easily comprehended by learners; and, according to it, the numbers are always alternately rational.

Questions in the Rule of Three are of two kinds, namely, *direct* and *inverse*; but both the foregoing Rules are *general*.

*Direct Proportion*, is when more requires more, or less requires less, as in the following examples: If 6 men can dig a trench 48 yards

in length, in a certain time; how many yards can 12 men dig in the same time? Here it is obvious, that the more men there are employed, the more work will they perform; and, therefore, in this case, more requires more.

Again, If 6 men can dig 48 yards, in a given time; how many yards can 3 men dig in the same time? Here less requires less; for the less number of men there are employed, the less work will there be performed by them.

All questions that are of this class, are said to be in the Rule of Three Direct.

5. *Inverse Proportion*, is when more requires less, or less requires more; thus, If 6 men can dig a certain quantity of trench in 12 hours; how many hours will it require 12 men to dig the same quantity? Here more requires less: for 12 men being more than 6, it is manifest, that they will require less time to perform the same work.

Again, If 6 men perform a piece of work in 10 hours; how many hours will 3 men be in performing the same work? Here less requires more; for the number of men being less, they will require more time to do the same quantity of work.

All questions of this kind are said to be in the Rule of Three Inverse.

#### EXAMPLES.

1. If 5.75 lb. of candles cost 4.25s. what will be the price of 17.25 lb.?

*By Rule I.*

lb.	lb.	s.	s.	s.	d.	
As 5.75	:	17.25	::	4.25	:	12.75 = 12 9 Ans.
		4.25				
		8625				
		3450				
		6900				
5.75)	73.3125	(12.75				
	575	12				
	1581	9.00				
	1150					
	4312					
	4025					
	2875					
	2875					

*By Rule II.*

lb.	s.	lb.	s.	s.	d.	
As 5.75	:	4.25	::	17.25	:	12.75 = 12 9 Ans.

2. If 17.25 lb. of candles cost 12.75s. what will 5.75 lb. cost?

*By Rule I.*

lb.	lb.	s.	s.	s.	d.
As 17.25	:	5.75	::	12.75	:
				4.25	=
				4	3

*Ans.*

*By Rule II.*

lb.	s.	lb.	s.	s.	d.
As 17.25	:	12.75	::	5.75	:
				4.25	=
				4	3

*Ans.*

3. What will 28.5 quarts of wine cost, if 9.75s. be paid for 3.25 quarts? *Ans.* £.4 5s. 6d.

4. If  $\frac{1}{2}$  cwt. of tobacco cost £.6 15s.; what will be the price of 3 cwt. 2 qr. 7 lb? *Ans.* £.48 1s. 10½d.

5. If £.3 5s. be given for 1 cwt. of tallow; what will be the price of 5 cwt. 3 qr. 14 lb. at the same rate? *Ans.* £.19 1s. 10½d.

6. What is the duty of 248½ barrels of ale, when 6d. is paid for 3 barrels? *Ans.* £.111 9s. 9½d.

7. If the duty of 3 barrels of table beer, amounts to 6d.; what will be the duty of 18½ barrels? *Ans.* £.1 14s. 4½d.

8. If the duty of  $\frac{3}{4}$  of a barrel of ale comes to 10½d.; what will be the duty of 16½ barrels? *Ans.* £.7 8s. 11½d.

9. What is the duty of  $\frac{7}{8}$  of a 1000 of polished bricks, when the duty of  $\frac{5}{8}$  of a 1000 amounts to 9s. 7½d.? *Ans.* 11s. 2½d.

10. If the duty of  $\frac{1}{10}$  of a 1000 of common bricks comes to 3½d.; what will be the duty of  $\frac{3}{4}$  of a 1000? *Ans.* 5s. 8½d.

11. What is the duty of  $\frac{4}{5}$  of a 1000 of common bricks, when the duty of  $\frac{1}{10}$  of a 1000 is 1½d.? *Ans.* 4s. 8d.

12. If the duty of 5 pounds of hard soap comes to 1d.; what is the duty of 42364 pounds? *Ans.* £.397 3s. 3d.

## SQUARE ROOT.

To extract the Square Root, is to find such a number as being multiplied by itself will produce the given number. Thus the Square Root of 25, is 5; because 5 squared, or multiplied by 5=25, the proposed number.

### RULE.

Divide the given number into periods of two figures each, by placing a point above every second figure; beginning at units place, and proceeding to the left in integers, and to the right in decimals.

Find the greatest square root contained in the first period on the left-hand, and place it on the right-hand of the given number, after the manner of a quotient figure in division.

Subtract the square of this root from the said period; and to the remainder bring down the two figures of the next period, for a dividend.

Double the root above mentioned, for a divisor; find how often it is contained in the dividend, exclusive of the right-hand figure; and place the result both in the quotient and the divisor.

Multiply the divisor thus augmented, by the last quotient figure; subtract the product from the dividend; and bring down the next period to the remainder, for a new dividend.

Repeat the same process for each period, and the quotient thus obtained will be the root required.

### *A Table of Squares and Roots.*

Squares	1.	4.	16.	25.	36.	49.	64.	81.
Roots	1.	2.	4.	5.	6.	7.	8.	9.

*Note 1.* The root will consist of as many integers and decimals as there are periods of each in the given number.

*2.* When the decimals in the given number do not consist of an even number of figures, they must be made even, by placing a cypher on the right; and when all the periods are brought down, the operation may be continued at pleasure, by annexing two cyphers to each remainder.

*3.* If the square root of a vulgar fraction be required, reduce it to a decimal, and then extract the root.

The best method of doubling the root, to form new divisors, add the last quotient figure to the last divisor.

The method of proof is to multiply the root into itself, add the remainder, if any, to the product, and the sum will be equal to the number, if the work be right.

EXAMPLES.

What is the square root of 642.1156?

$$\begin{array}{r}
 \dot{6}4\dot{2}.\dot{1}\dot{1}\dot{5}\dot{6} (25.34 \text{ Ans.} \\
 \underline{4} \\
 45)242 \\
 \underline{225} \\
 503)1711 \\
 \underline{1509} \\
 5064)20256 \\
 \underline{20256} \\
 \hline
 \hline
 \end{array}$$

$$\begin{array}{r}
 \text{Proof.} \\
 25.34 \\
 25.34 \\
 \hline
 101.36 \\
 7602 \\
 12670 \\
 5068 \\
 \hline
 642.1156 \\
 \hline
 \hline
 \end{array}$$

What is the square root of 1048576? *Ans.* 1024.

Required the square root of 983. *Ans.* 31.352.

What is the square root of 8104.2684? *Ans.* 90.023.

Find the square root of 744.326. *Ans.* 27.282.

Extract the square root of .0000178929.

*Ans.* .00423.

What is the square root of  $\frac{302}{4}$ ? *Ans.* .802.

Extract the square root of  $\frac{38888}{418}$ . *Ans.* .8367.

What is the square root of  $\frac{1}{2}$  of  $\frac{2}{3}$  of  $\frac{4}{5}$  of  $\frac{3}{4}$ ? *Ans.* .7099.

## SQUARE ROOT,

APPLIED IN SOLVING USEFUL MATHEMATICAL PROBLEMS.

### PROBLEM I.

*To find a mean proportional between two given numbers.*

#### RULE.

Multiply the two given numbers together, and the square root of their product will be the mean proportional sought.

#### EXAMPLES.

1. What is the mean proportional between 20 and 45 ?

$$\begin{array}{r} 45 \\ 20 \\ \hline 900 \end{array} \begin{array}{l} 30 \text{ Ans.} \\ 9 \\ \hline 00 \\ \hline \end{array}$$

2. There are three numbers in geometrical progression ; the first is 48, and the third 243, what is the middle number ? *Ans.* 108.

3. In a pair of false scales, a body weighed 36 lb. in one scale, but only 16 lb. in the other ; required its true weight ; and the ratio of the lengths of the two arms of the balance on each side of the point of suspension.

*Ans.* The true weight of the body is 24 lb. and the arms of the balance are to each other as 16 to 24, or as 24 to 36, or as 2 to 3.

### PROBLEM II.

*To find the side of a square equal in area to any given superficies.*

#### RULE:

Extract the square root of the number expressing the

erficies of the given figure ; and it will be the side of square equal in area.

etc. The definitions of Geometrical Figures, and the methods of finding their areas may be seen in Parts III. and IV.

#### EXAMPLES.

The area of a rectangular floor is 2025 square feet ; what will be the side of a square floor of equal area ?

*Ans. 45 feet.*

The area of the base of a triangular cistern is 324 square feet ; required the side of a square cistern that be equal in area.

*Ans. 18 feet.*

A maltster has a rectangular kiln whose area is 144 square feet ; what must be the side of a square one, which he intends to build, so that the latter may dry times as much malt at a time as the former ?

*Ans. 24 feet.*

#### PROBLEM III.

*Find the diameter of a circle, when the area is given.*

#### RULE.

Divide the area by .7854, and the square root of the quotient will be the diameter required.

#### EXAMPLES.

The area of a circle is 8824.7 square inches ; what is the diameter ?

*Ans. 106 inches, nearly.*

The area of the head of a cask is 254.5 square inches ; required the head diameter.

*Ans. 18 inches.*

#### PROBLEM IV.

*Find the hypotenuse of a right-angled triangle, when the base and perpendicular are given,*

#### RULE.

Add the square of the base to the square of the perpendicular, and the square root of the sum will be the hypotenuse.

## EXAMPLES.

1. The base of a right-angled triangle is 105, and perpendicular 56 inches ; what is the hypotenuse ?

*Ans. 119 inches*

2. The length of a cistern in the form of a parallelopipedon is 112, and its breadth 84 inches ; what is the diagonal of its bottom ?

*Ans. 140 inches*

3. The side of a cubical mash-tun is 72.5 inches ; what is the diagonal of its bottom ?

*Ans. 102.53 inches*

## PROBLEM V.

*Given the hypotenuse of a right-angled triangle, and either of the legs, to find the other leg.*

## RULE.

From the square of the hypotenuse subtract the square of the given leg, and the square root of the remainder will be the required leg.

## EXAMPLES.

1. The hypotenuse of a right-angled triangle is 153 and the base 135 inches ; what is the perpendicular ?

*Ans. 72 inches*

2. The diagonal of a cylindrical vessel is 60, and the diameter of its bottom 36 inches ; what is its perpendicular depth ?

*Ans. 48 inches.*

3. The length of a guile-tun, in the form of a parallelopipedon, is 78, the longest diagonal that can be measured within it 125, and the diagonal of its bottom 100 inches ; required its depth and breadth.

*Ans. Its depth is 75, and its breadth 62.577 inches.*

## PROBLEM VI.

*Given the head and bung diameters and length of a cask, to find the diagonal or distance between the centre of the bung-hole and that point where the middle of the opposite staff and head of the cask intersect each other.*

## RULE.

To the square of half the sum of the diameters, add

the square of half the length of the cask ; and the square of the sum will be the diagonal.

## EXAMPLES.

1. The length of a cask is 30, the bung diameter 24, and the head diameter 18 inches ; required the diagonal.  
*Ans. 25.8 inches.*
2. The bung and head diameters of a cask are 32 and 24 inches, and the length is 40 inches ; what is the diagonal ?  
*Ans. 34.4 inches.*

## PROBLEM VII.

Given the diagonal and diameters of a cask, to find its length.

## RULE.

From the square of the diagonal take the square of the sum of the diameters ; and twice the square root of the remainder will be the length of the cask.

## EXAMPLES.

1. The bung diameter of a cask is 24, the head diameter 18, and the diagonal 25.8 inches ; what is the length of the cask ?  
*Ans. 30 inches, nearly.*
2. The bung diameter of a cask is 35, the head diameter 29, and the diagonal 40 inches ; required the length.  
*Ans. 48 inches.*

## CUBE ROOT.

To extract the Cube Root is to find such a number as being multiplied by itself, and that product again by the same number, will produce the given number. Thus the Cube Root of 125, is 5 ; because 5 squared, or multiplied by 5, and that product by 5 = 125, the proposed number.

## RULE.

Divide the given number into periods of three figures each, by placing a point above every third figure ; be-

ginning at unit's place, and proceeding to the left in integers, and to the right in decimals.

Find the greatest cube root contained in the first period, on the left-hand, and place it on the right-hand of the given number, after the manner of a quotient figure in division.

Subtract the cube of this root from the first period ; to the remainder annex the three figures in the following period ; and call this number the resolvend.

Under the resolvend, write three times the root above found, and also three times its square ; placing the latter one figure to the left of the former ; and call their sum the divisor.

Find how often this divisor is contained in the resolvend, exclusive of the place of units ; and set the result in the quotient, to the right of the root already found.

Under the divisor write the cube of the last quotient figure ; its square multiplied by three times the former figure ; and its triple multiplied by the square of the former figure ; placing each one figure to the left ; and call their sum the subtrahend.

Subtract the subtrahend from the resolvend, and to the remainder bring down the next period, for a new resolvend, with which proceed as before ; always repeating the same process for each period, and the quotient thus obtained will be the root required.

*Note 1.* The last figure of the root, in each operation, must be so taken that the subtrahend may be less than the resolvend.

2. When the decimals in the given number do not form exact periods, the defect must be supplied by placing cyphers on the right ; and when all the periods are brought down, the operation may be continued at pleasure, by subjoining three cyphers to each remainder.

3. The cube root of a vulgar fraction may be obtained by reducing it to a decimal, and then extracting the root.

### *A Table of Cubes and Roots.*

Cubes	1,	8,	27,	64,	125,	216,	343,	512,	729.
Roots	1,	2,	3,	4,	5,	6,	7,	8,	9.

### EXAMPLES.

1. What is the cube root of 52734375.

$\begin{array}{r} \cdot \\ \cdot \\ \cdot \\ 52734375 \end{array} (375 \text{ Ans.}$

$\begin{array}{r} 27 \\ \hline \end{array}$

$\begin{array}{r} 25734 \\ \hline \end{array}$  resolvend.

9 triple of 3.

27 triple square of 3.

$\begin{array}{r} 279 \\ \hline \end{array}$  divisor.

343 cube of 7.

441 square of  $7 \times$  by the triple of 3.

189 triple of  $7 \times$  by the square of 3.

$\begin{array}{r} 23653 \\ \hline \end{array}$  subtrahend.

$\begin{array}{r} 2081375 \\ \hline \end{array}$  second resolvend.

111 triple of 37.

4107 triple square of 37.

$\begin{array}{r} 41181 \\ \hline \end{array}$  second divisor.

125 cube of 5.

2775 square of  $5 \times$  by the triple of 37.

20535 triple of  $5 \times$  by the square of 37.

$\begin{array}{r} 2081375 \\ \hline \hline \end{array}$  second subtrahend.

Required the cube root of 63044792.

*Ans.* 398.

What is the cube root of 958585256?

*Ans.* 986.

Required the cube root of 633.839779.

*Ans.* 8.59.

What is the cube root of 1006.012008?

*Ans.* 10.02.

Required the cube root of .898632125.

*Ans.* .963.

What is the cube root of  $\frac{4}{27}$ ?

*Ans.* .967.

## CUBE ROOT,

APPLIED IN SOLVING USEFUL MATHEMATICAL PROBLEMS.

### PROBLEM I.

Find the side of a cubical vessel that shall be equal in content to any given vessel whose form is that of a parallelepipedon, a cylinder, a prism, a cone, &c. &c.

### RULE.

Extract the cube root of the content of the given ves-

sel, and it will be the side of the cubical vessel required.

*Nota.* When the content of the given vessel is in ale or wine gallons, or malt bushels, it must be brought into inches, by multiplying by 282 for ale gallons, 231 for wine gallons, and 2150.42 for malt bushels; these being the cubic inches contained in one gallon, and one bushel respectively.

#### EXAMPLES.

1. The content of a vessel in the form of a parallelopipedon is 216000 cubic inches; what must be the side of a cubical vessel that shall be equal in content?

*Ans.* 60 inches.

2. A cylindrical vessel contains 48 gallons of wine; what must be the side of a cubical vessel that will contain the same quantity of rum?

*Ans.* 21.496 inches.

3. A maltster has a cistern in the form of a square prism, that will contain 48 bushels of barley; what must be the side of a cubical cistern that will hold the same quantity?

*Ans.* 46.908 inches.

#### PROBLEM II.

*Given the dimensions of any vessel, to find the dimensions of another similar vessel, that shall be any number of times greater or less than the given vessel.*

#### RULE.

Multiply the cubes of the dimensions of the given vessel by the given ratio, if the required vessel is to contain more, but divide the said cubes by the ratio, if it is to contain less; and the cube roots of the products or quotients will be the dimensions required.

#### EXAMPLES.

1. The length of a vessel in the form of a parallelopipedon is 216, its breadth 125, and its depth 64 inches; required the dimensions of a similar vessel that shall contain 8 times as much.

*Ans.* The length is 432, the breadth 250, and its depth 128 inches.

2. The depth of a cylindrical vessel is 64, and its diameter 27 inches; required the depth and diameter of a similar vessel that shall contain 27 times as much.

*Ans.* The depth is 192, and the diameter 81 inches.

The depth of a cylindrical vessel is 343, and its diameter 125 inches; what must be the dimensions of a similar vessel that shall contain no more than  $\frac{1}{8}$  of the capacity?

*Ans. The depth is 171.5, and the diameter 62.5 inches.*

The length of a cask is 30, the bung diameter 24, the head diameter 18 inches; required the dimensions of a similar cask that shall contain three times as much.

*Ans. The length is 43.267, the bung diameter 34.614, the head diameter 25.96 inches.*

### PROBLEM III.

*Find the dimensions and content of any vessel, to find the dimensions of a similar vessel of a given content.*

#### RULE.

Euclid's Elements, book the 11th, proposition the 11th and book the 12th, propositions the 12th and 18th, content of any solid, is to the cube of its dimensions, so is the content of any similar solid, to the cube of its dimensions. (See Theo. 20, Part III.)

#### EXAMPLES.

The content of a vessel in the form of a parallelepipedon, is 2625 cubic inches, its length 25, its breadth 10 and its depth 7 inches; required the dimensions of a similar vessel whose content shall be 21000 cubic inches.

*Ans. The length is 50, the breadth 30, and the depth 14 inches.*

The diameter of a cylindrical vessel is 30 inches, its depth 50, and its content 125.33 ale gallons; what must be the diameter and depth of a similar vessel that shall contain only 68.5 gallons?

*Ans. The diameter is 24.52, and the depth 40.88 inches.*

The bottom diameter of a vessel in the form of the frustum of a cone, is 46 inches, the top diameter 62, the height 60, and the content 599.45 wine gallons; what must be the dimensions of a similar vessel that shall contain only 149.86 gallons?

must be the dimensions of a similar vessel that shall contain 946 gallons?

*Ans. The bottom diameter is 58.55, the top diameter 72.18, and the depth 69.85 inches.*

4. The length of a cask is 30 inches, the bung diameter 24, the head diameter 18, and its content 38.75 ale gallons; required the dimensions of a similar cask that shall contain 55.5 gallons.

*Ans. The length is 33.82, the bung diameter 27.05, and the head diameter 20.28 inches.*

---

## PART II.

*A DESCRIPTION of the SLIDING RULE; with Directions how to find any Number upon it; and also the Application of the different Lines to Multiplication, Division, the Rule of Three, and the Extraction of the Square and Cube Roots.*

---

### DESCRIPTION OF THE SLIDING RULE.

THIS Instrument is in the form of a parallelopipedon; has four sliding pieces, which run in grooves, and is commonly made of box. It was invented by Mr. Thomas Everard, about the year 1683, and is generally called Everard's Sliding Rule.

It is of various lengths, as 6, 9, 12, 18 inches, &c.; but 12 inches is the most common length.

This instrument is much used in Gauging, in consequence of the ease and expedition with which calculations may be made by it.

#### *Lines on the first Face of the Rule.*

Upon the first face of the Rule, is a line of numbers, marked A, which is called Gunter's Line, from its inventor, Mr. Edmund Gunter; and is numbered from the left to the right with the figures 1, 2, 3, 4, 5, 6, 7, 8, 9, 10;

the spaces between each of these figures are graduated subdivisions.

2150.42, is a brass pin marked M B, signifying cubic inches in a bushel of malt; and at 282 is another brass pin, marked A, denoting the number of inches in a gallon of ale.

A second line on this face is upon the slide, and is marked by the letter B. It is divided exactly in the same manner as that marked A. There is also another slide which is used with the former; the two brass ends when placed together, in which position they form a radius numbered from the left to the right.

231, on the second slide or radius, is a brass pin marked W, denoting the cubic inches in a gallon of wine; and at 3.1416 is another brass pin, marked C, signifying the circumference of a circle whose diameter is

one inch. On these lines, multiplication, division, proportion, &c., may be performed; and the manner of reading and using them will be described hereafter.

On the back of the first slide, marked B, are placed divisors for ale, wine, mash-tun gallons, malt-bushels, starch, dry starch, hard soap hot, hard soap cold, &c., as in the Table of Factors, Divisors, &c., Part IV; the back of the second slide, marked B, contains the points corresponding to these divisors, where S is for squares, and C for circles.

On the same face of the Rule, is another line marked D, signifying malt-depth; and is numbered from right to the left, with the figures, 3, 4, 5, 6, 7, 8, 9,

10. 1 or 10 on this line is placed directly opposite to 1 on the line A; and if it be called 1000, the last number at the left-end of the rule, will denote 2150.42, cubic inches in a Winchester bushel; but if 10 be called 1, the last division at this end will be 2.15, the same as the first division at the right-end of the Rule. This line is used with the line A, and the slides B or C for malt gauging.

#### *Lines on the second Face of the Rule.*

On the second face of the Rule, or that opposite to D

the one already described, is a line marked D. This line begins on the upper edge of the Rule, and is numbered from the left to the right with the figures, 1, 2, 3, 31, 32, which is at the right-end of the Rule; the line is then continued from the left-end of the lower edge, 32, 4, 5, 6, 7, 8, 9, 10, which is the last division.

At 17.15 is a brass pin, marked W G, signifying the circular gauge-point for wine gallons; and at 18.95, the circular gauge-point for ale gallons, is another brass pin marked A G.

There is also another brass pin at 46.37, marked M S, which is the square gauge-point for malt bushels; and at 52.32, is another marked M R, denoting the round or circular gauge-point for malt bushels.

On this line the gauge-points for ale gallons, wine gallons, &c. may also be found although they are not pointed out by letters and brass pins.

The second line on this face of the Rule, is marked C, which is upon the slide, and is numbered and divided in the same manner as the lines A and B. Belonging to the Rule is also another slide C, which is used with the former, in the same manner as the two slides marked B.

The line D, and the two slides C, are used in finding the contents of vessels whose form is that of a cube, a parallelopipedon, a cylinder, &c. &c.

By these lines the square root of any number may also be readily extracted; for if 1 on C be set to 1 on D, we have against any proposed number on C, its root on D.

The back of the first slide, marked C, is divided, next the upper edge, into inches and tenths; and numbered from the left to the right, with 1, 2, 3, 4, 5, &c.; the second line is marked *spheroid*, and the third line, *second variety*, and both are numbered from the left to the right with the figures 1, 2, 3, 4, 5, &c., and the spaces between each of these figures are divided into ten equal parts.

These three lines are used for finding a mean diameter between the head and bung diameters of casks of the first and second varieties, which is performed in the following manner: Find the difference between the bung and head diameters, on the first line, or line of inches, then against it, for each variety, is a number, which being added to the head, will give the mean diameter sought; hence the cask is reduced to a cylinder.

back of the second slide, marked C, contains multipliers for reducing goods of one denomination to their equivalent values in those of another: Thus T 5. | signifies that to reduce strong beer at 10s. per barrel, to small beer at 2s. per barrel, you must multiply the number of gallons of strong beer by 5; and the result will be the equivalent number of gallons of small beer. | T to X .2 | signifies that small beer at 2s. per barrel, must be multiplied by .2, in order to reduce strong beer at 10s. per barrel. | C to X 1.62 | signifies that to reduce cyder at 1s. 10d. per hogshead, to small beer at 10s. per barrel, the number of gallons of cyder must be multiplied by 1.62; and to reduce strong cyder, the multiplier is .62.

In consequence of the various changes that have, at different times, taken place in the duties upon beer, cyder, &c. &c., scarcely any of the Rules can be met with that are correct in these multipliers. (See a Problem on this subject, in Part VI.)

### *Lines on the third Face of the Rule.*

The third face of the Rule contains a line marked Seg. S, signifying segments standing; and is numbered from left to the right on the upper edge of the Rule, 1, 2, 3, 4, 5, 6, 7, 8; it is then continued on the lower edge, 8, 9, 10, 20, 30, &c. to 100.

This line is used with the two slides, marked C, in finding the ullage of a standing cask, or the quantity of it contains when it is not full.

### *Lines on the fourth Face of the Rule.*

On the fourth face of the Rule, or the one opposite to the last described, is a line marked Seg. Ly. or S L, signifying segments lying. This line is numbered nearly in the same manner as the last, and is used with the slides in finding the ullage of lying casks.

These are all the lines that are upon this Rule, which, in our opinion, better adapted for practice, than any with which we are acquainted.

There are various kinds of Sliding Rules, some of which are marked E, for extracting the cube roots of numbers, and some have a line for the third variety of casks; they are however, all upon the

same principle, and may be easily understood from the foregoing description.

There is also a rule called Branan's Rule, which has lines of numbers upon it similar to those described on the sliding rule; and may be used in most cases with the same advantage. (See Cask Gauging.)

### THE METHOD OF ESTIMATING THE VALUES OF THE DIVISIONS ON THE SLIDING RULE.

The lines marked A, B, C, and D, on this instrument are all logarithmic lines, and are divided into spaces which are proportional to the logarithms of the numbers placed at their ends.

These lines were first placed on Rules by Mr. Edmund Gunter, who in the year 1624, first made the discovery of applying logarithms to extension; and of performing, with great facility, by means of a pair of compasses, and the line of numbers, the business of Multiplication, Division, and all Arithmetical operations, where the Rule of Proportion is required. The use of compasses, however, being found both troublesome and inaccurate, Mr. Thomas Everard, about the year 1683, made a very essential improvement in the application of the line of numbers, by contriving one line to slide by another; and the Rule has since been further improved by Mr. Verie.

In order to obtain a proper knowledge of the line of numbers, it is necessary that you make yourself well acquainted with the values of the different divisions.

Whatever value you assign to 1, at the beginning of the line, whether 1, 10, 100, or 1000, the following integral numbers 2, 3, 4, &c. will represent twice, thrice, four-times, &c. as much; consequently, the second 1 will be 10 times the value of the first, and the third 1 will express 100 times the value of the first, or 10 times the value of the second. Thus the values of the integral divisions being known, those of the subdivisions may be easily ascertained; being always the quotient obtained by dividing the difference of any two adjoining integral numbers, by the number of parts contained between them.

*Divisions on the lines A, B, and C.*

between the figures 1 and 2, on the line A, into 10 larger divisions, and 50 smaller we call one at the beginning of this line, will the following figures denote two, three, &c. as the difference of the integral divisions; the value of each of the larger subdivisions will be by  $\frac{1}{10}$  or .1; and the value of each of the smaller subdivisions by  $\frac{1}{50}$  or .02; consequently the 1st, 2nd, 3rd, 4th, 5th, &c. divisions, from 1, will be increased by  $1\frac{1}{10}$ ,  $1\frac{2}{10}$ ,  $1\frac{3}{10}$ ,  $1\frac{4}{10}$ ,  $1\frac{5}{10}$ , &c. or in decimals, 1.1, 1.2, 1.3, 1.4, 1.5, &c.

At the beginning of the line 10, then will the figures be read 20, 30, 40, &c.; and the 1st, 2nd, 3rd, &c. divisions, from 10, be increased by  $10\frac{1}{10}$ ,  $10\frac{2}{10}$ ,  $10\frac{3}{10}$ ,  $10\frac{4}{10}$ ,  $10\frac{5}{10}$ , &c. or in decimals, 10.1, 10.2, 10.3, 10.4, 10.5, &c.; hence it appears that the larger divisions will be a unit, when the smaller are divided 10; and many of the new Rules, are such a manner as to read 10, 11, 12, 13, &c.

What has been already advanced on this subject will be comprehended by inspecting the following

2, the tenths are divided into five parts, each containing two hundredths; therefore,

$$\left. \begin{array}{l} .1 \\ 1. \\ 10. \\ 100. \end{array} \right\} \begin{array}{l} \text{Then will} \\ \text{the larger} \\ \text{divisions} \\ \text{represent} \end{array} \left\{ \begin{array}{l} .01 \\ .1 \\ 1. \\ 10. \end{array} \right\} \begin{array}{l} \text{And} \\ \text{the} \\ \text{smaller} \\ \text{divisions} \end{array} \left\{ \begin{array}{l} .002 \\ .02 \\ .2 \\ 2. \end{array} \right.$$

5, the tenths are divided into two parts, each containing five hundredths; therefore,

$$\left. \begin{array}{l} .2 \\ 2. \\ 20. \\ 200. \end{array} \right\} \begin{array}{l} \text{Then will} \\ \text{the larger} \\ \text{divisions} \\ \text{represent} \end{array} \left\{ \begin{array}{l} .01 \\ .1 \\ 1. \\ 10. \end{array} \right\} \begin{array}{l} \text{And} \\ \text{the} \\ \text{smaller} \\ \text{divisions} \end{array} \left\{ \begin{array}{l} .005 \\ .05 \\ .5 \\ 5. \end{array} \right.$$

10, the tenths are not divided at all; consequently the hundredths must be guessed at; therefore,

If the figure 5  $\left\{ \begin{array}{l} .5 \\ 5. \\ 50. \\ 500. \end{array} \right\}$  The tenths will represent  $\left\{ \begin{array}{l} .01 \\ .1 \\ 1. \\ 10. \end{array} \right\}$

*Divisions on the line D.*

From 1 to 2, the tenths are divided into ten parts, each hundredths; therefore,

If the figure 1, at the beginning of the line represent  $\left\{ \begin{array}{l} .1 \\ 1. \\ 10. \\ 100. \end{array} \right\}$  Then will the larger divisions represent  $\left\{ \begin{array}{l} .01 \\ .1 \\ 1. \\ 10. \end{array} \right\}$  And the smaller divisions  $\left\{ \begin{array}{l} .001 \\ .01 \\ .1 \\ 1. \end{array} \right\}$

From 2 to 3, the tenths are divided into five parts, each part containing two hundredths; therefore,

If the figure 2, represent  $\left\{ \begin{array}{l} .2 \\ 2. \\ 20. \\ 200. \end{array} \right\}$  Then will the larger divisions represent  $\left\{ \begin{array}{l} .01 \\ .1 \\ 1. \\ 10. \end{array} \right\}$  And the smaller divisions  $\left\{ \begin{array}{l} .002 \\ .02 \\ .2 \\ 2. \end{array} \right\}$

From 3 to the end of the line D, the tenths are divided into two parts, each part containing five hundredths; therefore,

If the figure 3 represent  $\left\{ \begin{array}{l} .3 \\ 3. \\ 30. \\ 300. \end{array} \right\}$  Then will the larger divisions represent  $\left\{ \begin{array}{l} .01 \\ .1 \\ 1. \\ 10. \end{array} \right\}$  And the smaller divisions  $\left\{ \begin{array}{l} .003 \\ .03 \\ .3 \\ 3. \end{array} \right\}$

From what has been said on this subject, it will be difficult to find the point upon any of the lines, which any given number is represented; for example let it be required to find 18.95 on the line D.

For the first figure 1, in the given number, call 1 the beginning of the line, 10; for the second figure count *eight* of the larger divisions as *units*, and you will have the point where 18 stands; then, from this point count *nine* of the smaller divisions for .9, and *half* of the next division for .05; and you will find the *brass point* marked A G, which is placed at 18.95, the circular gauge point for ale gallons.

gain, Suppose it be required to find .001895, .01895, .1895, 1.895, 18.95, 189.5, and 1895; they will all be found at the same point; but the figure 1, at the beginning of the line, must be conceived to be of a different value, in finding each number; viz. .001, .01, .1, 1, 10, 100, and 1000.

By this method of counting, you will find 17.15, at the point marked W G; 46.87 at M S; and 52.32 at M R. On the line A, you will find 2150.42 at the point marked M B, and 282, at that marked A.

Lastly, Let it be required to find 305, on the line A. The figure 3, on this line, must be counted 300; and the second figure, in the given number, is a cypher, at no tenths; but for the last figure 5, count *half* a division, or *one* of the smaller divisions, and you will have the required number 305.

## THE USE OF THE SLIDING RULE.

### PROBLEM I.

*Multiplication by the lines A and B.*

#### RULE.

As unity on A is to the multiplier on B, so is the multiplicand on A to the product on B.

Or,

As unity on B is to either of the factors, on A, so is the other factor on B to the product on A.

*Note 1.* It will sometimes happen that when the multiplier on B, is set to unity on A, the multiplicand cannot, according to the true operation of the Rule, be properly expressed on A; in such cases, after having set one of the factors on B, to unity on A, divide the other factor by some power of 10,—viz. 10, 100, 1000, &c. so that the quotient may be found on A, opposite to some division, or product, on B; then multiply this product by the same power of 10, by which the given factor was divided, and the number thus obtained will be the product required. Or, which is the same thing, after having set one of the factors on B, to unity on A, in finding the other

factor on A, call *unity* 10, 100, 1000, &c. as the case may require; and in estimating the product on B, whatever number you called unity, in valuing the factor on that line, you must increase it in the same proportion as you have done unity on A.

2. When the product consists of more than three or four figures, it is difficult to value the latter figures on the Rule; but in this case, it will be easy to bear one or two in the memory: Thus, if it were required to multiply 56 by 38, the product will be 2128; for the last figure is known to be an 8, by multiplying 6 by 8, mentally; and it is evident, from the Rule, that the product is more than 2118, and less than 2138.

3. If both the multiplicand and multiplier are whole numbers, the product will be a whole number; if one be a whole number, and the other a mixed number, or both mixed numbers, the product will be a mixed number; and if they both be decimals; the product will be a decimal. Also, the product will always have as many decimal places in it, as there are in both the factors.

#### EXAMPLES.

1. What is the product of 9 multiplied by 7?

*Set 7 on B to 1 on A, then against 9 on A, is 63 on B.*

*Or, by Proportion,*

*As 1 on A : 7 on B :: 9 on A : 63 on B; Or, As 1 on B : 7 on A :: 9 on B : 63 on A.*

2. Required the product of 15 multiplied by 8.

*Ans. 120.*

3. It is required to multiply 64 by 24.

*Ans. 1536.*

4. What is the product of 265 by 128?

*Ans. 33920.*

5. Multiply 8.5 by 5.8.

*Ans. 45.05.*

6. Multiply 4.7 by 3.5.

*Ans. 16.45.*

7. Multiply 3.5 by 1.7.

*Ans. 5.95.*

8. Multiply 6.2 by 2.4.

*Ans. 14.88.*

9. Multiply 1.8 by .9.

*Ans. 1.62.*

10. Multiply 64.7 by 32.8.

*Ans. 2122.16.*

11. Multiply 86.3 by .32.

*Ans. 27.616.*

12. Multiply .562 by .238.

*Ans. 133756.*

## PROBLEM II.

*Division by the lines A and B.*

### RULE.

As the divisor on B is to unity on A, so is the dividend on B to the quotient on A.

Or,

As the divisor on A is to unity on B, so is the dividend on A to the quotient on B.

1. When the divisor on B is set to unity on A, if the dividend be properly expressed on B, according to the true numeration of the number, you must divide it by some power of 10, and multiply the quotient by the same number by which you divide the dividend. (See Note in the last Problem.)

If the divisor and dividend be both whole numbers, and the divisor be less than the dividend, the quotient will be a whole, or a mixed number; but if the divisor be greater than the dividend, the quotient will be a decimal. Also, if the divisor be a whole number, and the dividend a decimal, the quotient will be a decimal; if the divisor be a decimal, and the dividend a whole number, the quotient will be either a whole, or a mixed number; and if both the divisor and dividend be decimals, the quotient will be a decimal when the divisor is greater than the dividend; but when it is equal to, or less than the dividend, the quotient will be either a whole, or a mixed number.

When the divisor is greater than the dividend, you must conceive a sufficient number of cyphers to be placed on the right of the dividend, as decimals; and you must always remember that there shall be as many decimal places in the quotient as the dividend contains less than the divisor.

It is sometimes difficult to know how many whole numbers, and how many decimals there should be in the quotient; but this may be ascertained by inspection: Thus, if it be required to divide 32 by 46; it is evident that there will be two whole numbers in the quotient, and the rest of the figures will be decimals.

Again, let it be required to divide 32 by 46. Here it is evident that there must be a cypher placed on the right of the dividend, before it can contain the divisor; hence, all the quotient will be decimals.

Lastly, let it be required to divide 22 by 365. Here it appears that three cyphers must be affixed to the dividend, before we can divide it by the divisor; hence all the quotient will be decimals, and the first figure on the left will be a cypher.

## EXAMPLES.

1. What is the quotient of 8 divided by 2?  
*Set 2 on B to 1 on A, then against 8 on B, is 4 on A ;*

*Or, by Proportion,*

*As 2 on B : 1 on A :: 8 on B : 4 on A ; Or, As 2 on A : 1 on B :: 8 on A : 4 on B.*

2. Divide 42 by 7. *Ans. 6*

3. Required the quotient of 96 divided by 8. *Ans. 12*

4. Divide 1536 by 24. *Ans. 64*

5. What is the quotient of 33920, divided by 128 ? *Ans. 265*

6. Divide 45.05 by 5.3. *Ans. 8.5*

7. What is the quotient of 16.45 divided by 4.7 ? *Ans. 3.5*

8. Divide 14.88 by 2.4. *Ans. 6.2*

9. Required the quotient of 1.62 divided by .9. *Ans. 1.8*

10. What is the quotient of 2122.16 divided by 32.8 ? *Ans. 64.7*

11. Divide 35 by 125. *Ans. .28*

12. What is the quotient of 15 divided by 632 ? *Ans. .0237*

## PROBLEM III.

*To find a fourth proportional to three numbers ; or to perform the Rule of Three by the lines A and B.*

## RULE.

As the first term on A, is to the second on B ; so is the third term on A, to the fourth on B.

*Note.* The method of finding a third proportional is exactly the same ; the second number being twice repeated : Thus, if a third proportional be required to 80 and 60 ; it will be as 80 on A : 60 on B :: 60 on A : 45 on B, the third proportional sought.

## EXAMPLES.

1. If 12 yards of cloth cost 56s. what will 18 yards cost at the same rate ?

$\begin{array}{cccc} \text{yds.} & \text{s.} & \text{yds.} & \text{s.} \\ \text{As } 12 \text{ on A} & : & 56 \text{ on B} & :: 18 \text{ on A} : 84 \text{ on B.} \\ \text{If } 44 \text{ gallons of ale cost } 55\text{s.} & \text{what will } 8 \text{ gallons} & & \\ & \text{Ans. } 10\text{s.} \\ \text{If } 24 \text{ candles weigh a pound, what is the weight of} & & & \\ \text{candles?} & & & \text{Ans. } 150 \text{ lb.} \\ \text{What is the fourth proportional to the three num-} & & & \\ \text{bers, } 24, 36? & & & \text{Ans. } 72. \\ \text{If } 3\frac{1}{4} \text{ bushels of malt cost } 28\text{s. } 6\text{d. what will } 8\frac{1}{2} & & & \\ \text{cost?} & & & \text{Ans. } 76.73\text{s.} \\ \text{If a gallon of rum cost } 19\text{s. } 9\text{d. what will } 45\frac{1}{2} \text{ gallons} & & & \\ & & & \text{Ans. } 898.6\text{s.} \end{array}$

### PROBLEM IV.

*Inverse Proportion by the lines A and B.*

#### RULE.

The third term on A, is to the first on B, so is the first on A, to the fourth on B.

#### EXAMPLES.

If 20 workmen can build a brew-house in 180 days; how many workmen can build it in 90 days?

$\begin{array}{cccc} \text{da.} & \text{men.} & \text{da.} & \text{men.} \\ 90 \text{ on A} & : & 20 \text{ on B} & :: 180 \text{ on A} : 40 \text{ on B.} \\ \text{How many gallons of rum at } 16\text{s. per gallon, are} & & & \\ \text{of value to } 8 \text{ gallons of brandy at } 20\text{s. per gallon?} & & & \\ & & & \text{Ans. } 10 \text{ gallons.} \end{array}$

If 8 men can do a piece of work in 18 days, in how many days can 48 men do it? *Ans. 3 days.*

If 2 Excise Officers can gauge and fix a certain number of utensils in 12 days, in how many days can 6 gauge and fix them? *Ans. 4 days.*

### PROBLEM V.

*Reduce a vulgar fraction to a decimal, by the lines A and B.*

#### RULE.

The denominator on A, is to unity on B, so is the numerator on A, to the required decimal on B.

## EXAMPLES.

1. Reduce  $\frac{1}{4}$  to a decimal fraction.

Denom.    Unity.    Num.    Decimal.

As 4 on A : 1 on B :: 1 on A : .25 on B.

2. Reduce  $\frac{1}{2}$  to a decimal. Ans. .5.  
 3. Reduce  $\frac{3}{4}$  to a decimal. Ans. .75.  
 4. Reduce  $\frac{5}{8}$  to a decimal. Ans. .25.

## PROBLEM VI.

*Having a divisor given, to find, by the lines A and B, a factor that shall perform the same by Multiplication as the divisor would do by Division.*

## RULE.

As the given divisor is to unity; so is unity to the factor sought.

## EXAMPLES.

1. If the divisor be 125, what will be the factor to that number?

As 125 on A : 1 on B :: 1 on A : .008 on B, the factor sought.

2. If the divisor be 282, what will be the factor?

Ans. .003546.

3. The divisor is 231, what is the factor?

Ans. .004329.

4. What is the factor to the divisor 2150.42?

Ans. .000465.

## PROBLEM VII.

*Having a factor given to find a divisor by the lines A and B.*

## RULE.

As the factor is to unity, so is unity to the divisor.

## EXAMPLES.

1. Find a divisor to the factor .008.

*As .008 on A : 1 on B :: 1 on A : 125 on B, the divisor sought.*

2. The factor is .003546, what is the divisor?

*Ans. 282.*

3. If a factor be .004329, what is the divisor?

*Ans. 231.*

4. Find a divisor to the factor .000465. *Ans. 2150.42.*

## PROBLEM VIII.

*To square any number by the lines C and D.*

## RULE.

Set 1 on D to 1 on C, then against the given number on D, is its square on C.

## EXAMPLES.

1. What is the square of 3?

*Set 1 on D to 1 on C; then against 3 on D, is 9 on C.*

2. Required the square of 12.

*Ans. 144.*

3. What is the square of 17.5?

*Ans. 306.25.*

4. Find the square of 125.8.

*Ans. 15825.64.*

## PROBLEM IX.

*To extract the Square Root of any number by the lines C and D.*

## RULE.

Set 1 on C to 1 on D, then against the given number on C, is its root on D.

## EXAMPLES.

1. What is the square root of 9?

*Set 1 on C to 1 on D; then against 9 on C, is 3 on D.*  
E

2. Required the square root of 144. *Ans.* 12.
3. What is the square root of 306.25 ? *Ans.* 17.5.
4. Find the square root of 15825.64. *Ans.* 125.8.

*Note.* When the Rule is set as directed in the last two Problems, the lines C and D form a table of squares and their roots.

### PROBLEM X.

*To find a geometrical mean proportional between two numbers, or to extract the Square Root of their product by the lines C and D.*

#### RULE.

Set one of the given numbers on C, to the same on D ; then against the other number on C, will be the mean on D.

#### EXAMPLES.

1. What is the mean proportional between 9 and 16 ?  
*Set 9 on C to 9 on D ; then against 16 on C, is 12 on D.*
2. What is the mean geometrical proportion between 48 and 248 ? *Ans.* 108.
3. Required the proportional between 18 and 32. *Ans.* 24.
4. Find the mean proportional between 96 and 486. *Ans.* 216.

### PROBLEM XI.

*To cube any number by the lines C and D.*

#### RULE.

Set 1 on D, to the root or given number on C ; then against the root on D, is the cube on C.

#### EXAMPLES.

1. What is the cube of 4 ?  
*Set 1 on D, to 4 on C ; then against 4 on D, is 64 on C.*
2. Required the cube of 12. *Ans.* 1728.

What is the cube of 18?  
 Required the cube of 35.

Ans. 5832.  
 Ans. 42875.

## PROBLEM XII.

*To find the Cube Root of any number by the lines C and D.*

### RULE.

Move the slide either way, until 1 at the beginning of D, 10 at the end of the line D, and the given number on C, cut the same number on the opposite lines; the number will be the root required.

### EXAMPLES.

What is the cube root of 8?

Set 1 on the line C, then move the slide until 1 on D, 8 at 10 on D, cut the same number on the opposite line; which you will find to be 2, the cube root required.

Required the cube root of 64.

Ans. 4.

What is the cube root of 120?

Ans. 4.93.

Required the cube root of 200.

Ans. 5.84.

What is the cube root 1728?

Ans. 12.

What is the cube root of 1000?

Ans. 10.

If the Sliding Rule has the line E upon it, set unity at the beginning of D, to unity at the beginning of E; then against any number on E, is its cube root upon D, and vice versa.

## PART III.

*Definitions, Problems, and Theorems, in Geometry.*

GEOMETRY originally signified the art of measuring length, or any distance or dimensions upon or within a body; it is now used for the science of quantity, extended magnitude, abstractedly considered.

GEOMETRY is divided into several parts, as *elementary, practical, and practical.*

*Elementary Geometry* treats of the properties and proportions of right lines, and right lined figures; and also of the circle and its several parts.

*Theoretical Geometry* has for its object the demonstration of certain geometrical theorems.

*Practical Geometry* is the performance of certain geometrical operations, such as the construction of figures, and the drawing of lines in certain positions, as parallel, perpendicular, &c. to other given lines.

#### GEOMETRICAL DEFINITIONS.

1. A point is considered as having neither length, breadth, nor thickness.

2. A line has length, but is considered as having neither breadth, nor thickness.

3. Lines are either right, curved, or parallel.

4. A right or straight line lies wholly in the same direction between its extremities, and is the shortest distance between two points.

5. A curved line continually changes its direction between its extremities.

6. Parallel lines always remain at the same distance from each other, though infinitely produced.

7. A superficies has length and breadth, but is considered as having no thickness.

8. A superficies may be contained within one curved line, but cannot be contained within fewer than three straight lines.

9. A solid is a figure of three dimensions; namely, length, breadth, and thickness.

10. An angle is the inclination or opening of two lines, having different directions, and meeting in a point, which is called the angular point, as at A; and when three letters are used, the middle one denotes that point.

11. Angles are of three kinds; viz. right, acute, and obtuse.

12. A right angle is made by two right lines which are perpendicular to each other.

13. An acute angle is less than a right angle, as C A B.

14. The complement of an angle is what it wants to complete a right angle, as the angle D A B is the complement of the angle C A B.

15. An obtuse angle is greater than a right angle,  $B C D$ .

16. The supplement of an angle is what it wants two right angles, as the angle  $A C D$ , is the supplement of the angle  $B C D$ .

17. A triangle is a figure or superficies bounded by three right lines, and admits of three varieties; viz. equilateral, isosceles, and scalene.

18. An equilateral triangle has all its sides equal.

19. An isosceles triangle has only two of its sides equal.

20. A scalene triangle has all its sides unequal.

21. Triangles are also right-angled, acute-angled, and obtuse-angled.

22. A right-angled triangle has one right angle, the side opposite to which is called the hypotenuse, the

other two being termed legs, or one the perpendicular, and the other the base ; thus  $A C$  is the hypotenuse,  $B C$  the perpendicular, and  $A B$  the base.

23. An acute-angled triangle has all its angles acute.

24. An obtuse-angled triangle has one of its angles obtuse, as  $A C B$ .

25. The base of any figure is that side upon which it is supposed to stand, or upon which a perpendicular is let fall from the vertex or opposite angle ; and the altitude of a figure is its perpendicular height. In the last figure  $A B$  is the base, and  $C D$  the perpendicular.

26. A figure of four sides and angles is denominated a quadrangle or quadrilateral figure.

27. A parallelogram is a quadrilateral figure, having its opposite sides parallel and equal, and admits of four varieties ; viz. the square, the rectangle, the rhombus, and the rhomboid.

28. A square is an equilateral parallelogram, having all its angles right angles.

29. A rectangle is a parallelogram, having its opposite sides equal, and all its angles right angles.

30. A rhombus is an equilateral parallelogram, having its opposite angles equal; two of which are acute, and two obtuse, which, in a regular rhombus, are 60 and 120 degrees.

31. A rhomboid or rhomboides is a parallelogram, having its opposite sides and angles equal; two of its angles being acute, and two obtuse; and when the figure is regular, the angles are 60 and 120 degrees.

32. A trapezium is a quadrilateral figure, whose opposite sides are not parallel to each other.

33. A diagonal is a right line joining the opposite angles of a quadrilateral figure, as A B.

34. A trapezoid is a quadrilateral figure, having two of its opposite sides parallel.

35. Plane figures having more than four sides, are generally called polygons; and receive their particular denominations from the number of their sides or angles.

36. A pentagon is a polygon of five sides; a hexagon of six; a heptagon of seven; an octagon of eight; a nonagon of nine; a decagon of ten; an undecagon of eleven; and a duodecagon of twelve.

37. A regular polygon has all its sides and angles equal; when they are unequal, the polygon is irregular.

38. A circle is a plane figure, bounded by a curved line, called the circumference, which is every where equidistant from a certain point within it, called the centre.

39. The diameter of a circle is a right line drawn through the centre, and terminating in the circumference on each side, as A B.

40. The radius of a circle is half the diameter, or it is a right line drawn from the centre to the circumference, as C D.

41. An arc of a circle is any part of the circumference, as the arc E H-F.

42. A chord is a right line joining the extremities of an arc, as the line E F; and the versed sine is part of the diameter cut off by the chord, as G H.

43. A segment is any part of a circle, bounded by an arc and its chord.

44. A semicircle is half of a circle, or a segment cut off by the diameter, as A D B.

45. A quadrant is the fourth part of a circle, as A D C.

46. A sector is any part of a circle bounded by an arc and two radii.

47. The circumference of every circle is supposed to be divided into 360 equal parts, called degrees; each degree into 60 equal parts, called minutes; and each minute into 60 equal parts, called seconds, &c.

48. The arc of a quadrant contains 90 degrees, which is the measure of a right angle.

49. An ellipse is a plane figure bounded by a curved line, called the circumference; but as the figure is not a circle, it is described from two points in the longest diameter, called the foci, or focuses.

50. The longest diameter that can be drawn within an ellipse, is called the transverse diameter, as A B; and the shortest, the conjugate diameter, as C D.

Sometimes these diameters are termed axes.

51. A right-lined figure is inscribed in a circle, or the circle circumscribes it, when all the angular points of the figure are in the circumference of the circle.

52. A right-lined figure circumscribes a circle, or the circle is inscribed in it, when all the sides of the figure touch the circumference of the circle.

53. Identical figures are such as have all the sides and all the angles of one, respectively equal to all the sides and all the angles of the other.

54. Similar figures are such as have all the angles of one, equal to all the angles of the other, each to each; and the sides about the equal angles proportional.

55. A Proposition is something proposed either to be done, or to be demonstrated; and is either a Problem or a Theorem.

56. A Problem is something proposed to be done.

57. A Theorem is something proposed to be demonstrated.

58. A Demonstration is a certain and convincing proof of the truth of some proposition.

59. A Corollary is a consequent truth, gained immediately from some preceding truth or demonstration.

60. A Scholium is a remark or observation made upon some preceding Problem, Theorem, or Demonstration.

## GEOMETRICAL PROBLEMS.

### PROBLEM I.

*To bisect a given line A B.*

From A and B as centres, with any radius, greater than half A B, in your compasses, describe arcs cutting each other in *m* and *n*. Draw the line *m C n*, and it will bisect A B in C.

*Notz.* In bisecting lines, drawing parallels, erecting perpendiculars, &c. &c. in the real Practice of Ganging, when the radius is too great to be taken in a pair of compasses, a measuring-tape, or a chalk-line must be used; and the intersections or arcs may be made with a pencil, or with chalk finely pointed, held at the end of the tape or line. The perpendiculars, parallels, &c. must also be struck by means of a chalk-line.

## PROBLEM II.

*To bisect a given angle  $A B C$ .*

From the point  $B$ , with any radius, describe the arc  $A C$ . From  $A$  and  $C$ , with the same, or any other radius, make the intersection  $m$ . Draw the line  $B m$  and it will bisect the angle  $A B C$ , as required.

## PROBLEM III.

*To draw a line parallel to a given line  $A B$ .*

**CASE 1.** When the parallel line is to pass through a given point  $C$ .

From any point  $m$ , in the line  $A B$ , with the radius  $m C$ , describe the arc  $C n$ . From the centre  $C$ , with the same radius, describe the arc  $m r$ . Take the distance  $C n$  in the compasses, and apply it from  $m$  to  $r$ . Through  $C$  and  $r$  draw the line  $D E$ , and it will be the parallel required.

**CASE 2.** When the parallel line is to be at a given distance from  $A B$ .

From any two points  $m$  and  $n$ , in the line  $A B$ , with a radius equal to the given distance, describe the arcs  $r$  and  $o$ . Draw the line  $C D$ , to touch these arcs, without cutting them, and it will be the parallel required.

*Note.* This Problem may be more easily performed by means of a parallel ruler, which may also be used to advantage in several operations in Practical Geometry.

#### PROBLEM IV.

To erect a perpendicular from a given point  $C$ , in a given line  $A B$ .

On each side of the point  $C$ , take any two equal distances,  $C m$  and  $C n$ . From  $m$  and  $n$ , as centres, with any radius greater than  $C m$  or  $C n$ , describe two arcs cutting each other in  $r$ . Draw the line  $C r$ , and it will be the perpendicular required.

## PROBLEM V.

*From a given point C, to let fall a perpendicular upon given line A B.*

With C as a centre, and any radius a little exceeding the distance of the given line, describe an arc cutting A B in *m* and *n*. With the centres *m* and *n*, and the same or any other radius exceeding half their distance, describe arcs intersecting each other in *r*. Draw the line C *r*; and CD will be the perpendicular required.

## PROBLEM VI.

*To find the centre of a given circle, or one already described.*

Draw any chord A B, and bisect it perpendicularly with C D, which will be a diameter. Bisect C D in the point *o*, which will be the centre required.

## PROBLEM VII.

*To make a triangle with three given lines, any two of which, taken together, must be greater than the third. (Euclid I. 22.)*

Let the given lines be  $AB=12$ ,  $AC=10$ , and  $BC=8$ .

From any scale of equal parts (which is to be understood as employed likewise in the following Problems) lay off the base  $AB$ . With the centre  $A$ , and radius  $AC$ , describe an arc. With the centre  $B$ , and radius  $BC$ , describe another arc, cutting the former in  $C$ . Draw the lines  $AC$  and  $BC$ , and the triangle will be completed.

*Note.* A trapezium may be constructed in the same manner; having the four sides and one of the diagonals.

## PROBLEM VIII.

*Having given the base, the perpendicular, and the place of the perpendicular upon the base, to construct a triangle.*

Let the base  $AB=12$ , the perpendicular  $CD=6$ , and the distance  $AD=7$ .

Make  $AB$  equal to 12, and  $AD$  equal to 7. At  $D$  erect the perpendicular  $DC$ , which make equal to 6. Join  $AC$  and  $BC$ , and the figure will be completed.

*Note.* A trapezium may be constructed in a similar manner, having one of the diagonals, the two perpendiculars let fall therefrom from the opposite angles, and the places of these perpendiculars upon the diagonal; and a trapezoid may be constructed by drawing the parallel sides perpendicularly to their base or given distance.

### PROBLEM IX.

*To describe a square whose side shall be equal to a given line.*

Let the given line  $AB=8$ .

Upon one extremity B, of the given line, erect the perpendicular BC, which make equal to AB. With A and C as centres, and the radius AB, describe arcs cutting each other in D. Join AD and CD and the square will be completed.

### PROBLEM X.

*To describe a rectangular parallelogram, whose length and breadth shall be equal to two given lines.*

Let the length  $AB=12$ , and the breadth  $BC=6$ .

At B erect the perpendicular BC, which make equal to 6. With A as a centre, and the radius BC, describe an

arc; and with C as a centre, and the radius A B, describe another arc, cutting the former in D. Draw the lines A D and C D, and the rectangle will be completed.

### PROBLEM XI.

*Upon a given right line to construct a regular rhombus.*

Let the given line A B = 8.

Draw the line A B equal to 8. With A and B as centres, and the radius A B, describe arcs cutting each other in D; then with B and D as centres, and the same radius, make the intersection C. Draw the lines A D, D C, and B C, and the rhombus will be completed.

### PROBLEM XII.

*To construct an irregular rhombus, having given its side and perpendicular height.*

Let the side = 8, and the perpendicular = 6.

Draw A B equal to 8; at A erect the perpendicular A E, which make equal to 6; and draw E C parallel to A B. From E, describe an arc with radius 8, cutting E C in D. Draw A D and B C, and the rhombus will be completed.

**A B.** With the radius  $A B$ , and  $A$  as a centre, make intersection  $D$ ; and with the same radius, and  $B$  as a centre, make the intersection  $C$ . Join  $A D$ ,  $D C$ , and  $C B$ , and the figure will be completed.

### PROBLEM XIII.

*Having any two right lines given, to construct a regular rhomboid.*

Let the given lines  $A B = 12$ , and  $B C = 6$ .

Draw the line  $A B$  equal to 12. Take in your compasses the line  $B C$ , and lay it from  $A$  to  $E$ . With  $A$  and  $E$  as centres, and the radius  $A E$ , make the intersection  $D$ . Then with  $B$  as a centre, and the same radius, describe an arc; and with  $D$  as a centre, and the radius  $A B$ , describe another arc, cutting the former in  $C$ . Draw the lines  $A D$ ,  $D C$ , and  $B C$ , and the rhomboid will be completed.

### PROBLEM XIV.

*Having given the base, the perpendicular, and the place of the perpendicular upon the base, to construct an irregular rhomboid.*

Let the base  $A B = 15$ , the perpendicular  $D E = 6$ , and the distance  $A E = 5$ .

Make  $AB$  equal to 15, and  $AE$  equal to 6. At  $E$  erect the perpendicular  $ED$ , which make equal to 6, and join  $AD$ . With the radius  $AB$ , and  $D$  as a centre, describe an arc; and with  $B$  as a centre, and the radius  $AD$ , describe another arc, cutting the former in  $C$ . Draw the lines  $DC$  and  $BC$ , and the figure will be completed.

*Note.* The sum of all the interior angles of any quadrilateral figure, is equal to four right angles.

### PROBLEM XV.

*Having the transverse and conjugate diameters given, to construct an ellipse.*

Let the transverse diameter  $AB=14$ , and the conjugate diameter  $CD=8$ .

Draw the two diameters to bisect each other perpendicularly in the centre  $o$ . With the radius  $Ao$ , and the centre  $D$ , intersect  $AB$  in  $F$  and  $f$ : these two points will be the foci of the ellipse. Take any point  $m$ , in the transverse diameter, and with  $F$  and  $f$  as centres, and the radius  $Am$ , describe the arcs  $G, G, g, g$ . Then with the same centres, and the radius  $Bm$ , describe arcs cutting the former in the points  $G, G, g, g$ . Thus you will have four points in the circumference of the ellipse. Again, take a second point  $n$ , in the transverse diameter, and proceeding as before, you will determine other four points. By the same method you may determine as many more as you please; through all of which, with a steady hand, draw the circumference of the ellipse.

*Note.* An ellipse may also be constructed as follows: Having found the foci  $F, f$ , as before, take a thread equal in length to the transverse diameter  $A B$ , and fasten its ends, with two pins, in the points  $F, f$ : then stretch the thread to its greatest extent; and by moving a pencil round, within the thread, keeping it always tight, you will trace out the curve of the ellipse. (See the 2nd Property of the Ellipse, Part V.)

### PROBLEM XVI.

*Upon a given line  $A B$ , to make a regular pentagon.*

Make  $Bm$  perpendicular to  $AB$ , and equal to half of it. Draw  $Am$ , and produce it till  $mn$  be equal to  $Bm$ . With the radius  $Bn$ , and  $A$  and  $B$  as centres, describe arcs cutting each other in  $O$ , which will be the centre of the circumscribing circle. From the point  $O$ , with the same radius, describe the circle  $ABCDE$ ; and apply the line  $AB$  five times to the circumference, marking the angular points, which connect with right lines, and the figure will be completed.

### PROBLEM XVII.

*Upon a given line  $AB$ , to make a regular hexagon.*

With  $A$  and  $B$  as centres, and the radius  $A B$ , describe arcs intersecting each other in  $o$ ; and with  $o$  as a centre, and the same radius, describe the circle  $A B C D E F$ . Apply the line  $A B$ , six times to the circumference, and it will form the hexagon required.

### PROBLEM XVIII.

*Upon a given line  $A B$ , to construct a regular octagon.*

On the extremities of the given line  $A B$ , erect the infinite perpendiculars  $A F$  and  $B E$ . Produce the line  $A B$ , both ways to  $m$  and  $n$ ; and with the lines  $A H$  and  $B C$ , each equal to  $A B$ , bisect the angles  $m A F$  and  $n B E$ . Draw  $C D$  and  $H G$  parallel to  $A F$  or  $B E$ , and each equal to  $A B$ . With  $D$  and  $G$  as centres, and the radius  $A B$ , describe arcs intersecting  $A F$  and  $B E$ , in the points  $F$  and  $E$ . Join  $G F$ ,  $F E$ , and  $E D$ , and the figure will be completed.

### PROBLEM XIX.

*In a given triangle  $A B C$ , to inscribe a circle.*

Bisect the angles  $A$  and  $B$ , with the lines  $A o$ ,  $B o$ , and  $o$  will be the centre of the required circle; and its radius will be the nearest distance to any one of the sides; hence the circle may be described.

### PROBLEM XX.

*About a given triangle  $A B C$ , to circumscribe a circle, or to describe the circumference of a circle through three given points  $A, B, C$ .*

Bisect the sides  $A B$ ,  $B C$ , with the perpendiculars  $m o$  and  $n o$ ; and  $o$  will be the centre of the circle, and its radius will be  $A o$ ,  $B o$ , or  $C o$ .

### PROBLEM XXI.

*To make a triangle equal to a given trapezium  $A B C D$ .*

Draw the diagonal  $D B$ , and parallel to it draw  $C E$ , meeting  $A B$  produced in  $E$ . Join the points  $D E$ , so shall the triangle  $A D E$  be equal to the trapezium  $A B C D$ .

## PROBLEM XXII.

*To make a right angle by the line of chords on the plane scale.*

Draw the unlimited line  $AB$ ; then take in your compasses  $60^\circ$  from the line of chords, and with  $A$  as a centre, describe the arc  $ED$ . Take  $90^\circ$  from the same scale, and set off that extent from  $D$  to  $C$ . Draw the line  $AC$ , and  $CAD$  will be the angle required.

## PROBLEM XXIII.

*make an acute angle that shall contain any number of degrees, suppose  $35^\circ 30'$ .*

Draw the unlimited line  $AB$ ; then take  $60^\circ$  in your compasses, and with  $A$  as a centre, describe the arc  $ED$ . Set off the angle  $35^\circ 30'$ , from  $D$  to  $C$ . Draw the line  $AC$ , and  $CAD$  will be the angle required.

## PROBLEM XXIV.

*make an obtuse angle that shall contain any number of degrees, suppose  $128^\circ 35'$ .*

Draw the indefinite line  $AB$ ; and with the chord of  $60^\circ$  in your compasses describe the arc  $DE$ . Set off from  $D$  to  $C$ ; and from  $C$  to  $G$  set off the excess of  $90^\circ$ , which is  $38^\circ 35'$ . Draw the line  $AG$ , and  $G$  will be the required angle.

### PROBLEM XXV.

*To find the number of degrees contained in any given angle  $BAC$ .*

With the chord of  $60^\circ$ , and  $A$  as a centre, describe arc  $mn$ . Take the distance  $mn$  in your compasses, apply it to the line of chords, and it will shew the number of degrees required.

*Note.* Angles may be more expeditiously laid down or measured by means of a semi-circle of brass, called "a Protractor," the arc of which is divided into 180 degrees.

### PROBLEM XXVI.

*Upon a given line  $AB$ , to make a regular polygon of a proposed number of sides.*

Divide  $360^\circ$  by the number of sides, and subtract the quotient from  $180^\circ$ ; and divide the difference by two.

Make the angles  $A B C$ , and  $B A C$  each equal to the quotient last found; and the point of intersection  $C$ , will be the centre of the circumscribing circle. With the radius  $A C$ . or  $B C$ , describe the circle; and apply the chord  $A B$  to the circumference the proposed number of times, and it will form the polygon required.

### PROBLEM XXVII.

*In any given circle to inscribe a regular polygon of any proposed number of sides; or to divide the circumference into any number of equal parts.*

Divide  $360^\circ$  by the number of sides, and make the angle  $A C B$ , at the centre, equal to the number of degrees contained in the quotient; and the arc  $A B$  will be one of the equal parts of the circumference; hence the polygon may be formed.

*Note.* The sum of all the interior angles of any polygon, whether regular or irregular, is equal to twice as many right angles, wanting two, as the figure has sides.

### PROBLEM XXVIII.

*To raise a perpendicular from any point  $D$ , in a given line  $A B$ , by a scale of equal parts.*

G

Make  $Dm=3$ ; and from the points  $D$  and  $m$ , with the distances 4 and 5, describe arcs intersecting each other in  $n$ . From  $D$ , through the point  $n$ , draw the line  $Dc$ , and it will be the perpendicular required.

*Note.* This Problem may be performed by any other numbers in the same proportion; but 3, 4, and 5 are the least whole numbers that will form a right angled triangle.

### PROBLEM XXIX.

*To find the centre of a given ellipse, or oval figure, and draw the transverse and conjugate diameters.*

Draw the line  $HL$ , in any part of the ellipse; then with one foot of your compasses on any assumed point  $a$ , at a convenient distance from  $HL$ , make the intersection  $b$ ; and with the same extent, and  $f$ , as a centre, taken at a convenient distance from  $b$ , upon the line  $HL$ , describe the arc  $nn$ ; from  $a$  as a centre, with the radius  $bf$ , describe another arc cutting  $nn$  in  $r$ ; through  $a$  and  $r$  draw the line  $GE$ , and it will be parallel to  $HL$ .

Bisect  $GE$  and  $HL$ , in the points  $s$  and  $c$ ; through these points draw the line  $FK$ ; bisect this line in the point  $O$ , which will be the centre of the ellipse.

From  $O$  as a centre, and any radius of a convenient length, intersect the circumference in the two points  $N$  and  $I$ ; join these points by the right line  $NI$ ; and

through the point  $d$ , in the middle of this line, and the centre  $O$ , draw the line  $A C$ , which will be the transverse diameter of the ellipse.

From the points  $e, e$ , taken at equal distances from the centre  $O$ , describe arcs intersecting each other in  $g, g$ ; through these points, and the centre  $O$ , draw the conjugate diameter  $B D$ , and it is done.

### PROBLEM XXX.

*To determine whether a given oval figure be greater or less than a true ellipse.*

By the last Problem, draw the transverse and conjugate diameters  $A C$  and  $B D$ . With the radius  $A O$  in the compasses, and  $D$  as a centre, find the two focuses  $F, F$ . Take a string equal in length to the transverse diameter  $A C$ , and make its ends fast, with two pins, at the focuses. Draw the string tight, so as to form the triangle  $F m F$ ; move the point  $m$  towards  $C$ , always keeping both parts of the string stretched, and if it every where coincide with the curve, the figure is a true ellipse; if it extend beyond the curve as at  $n$ , it is less than an ellipse; and if it fall short of the curve as at  $r$ , it is evidently greater than an ellipse. (See Prob. 15.)

*Note.* The last two Problems are frequently of considerable utility in Practical Gauging.

## PROBLEMS

IN

*PRACTICAL GEOMETRY,*

FOR THE EXERCISE OF THE LEARNER.

---

1. The length of a given line A B, is 15 inches ; it is required to lay it down by a scale of equal parts, and bisect it geometrically.

2. It is required to bisect a given angle A B C.

3. Draw a line C D, parallel to a given line A B, at the distance of eight-tenths of an inch.

4. A given line measures 18 inches ; it is required to erect a perpendicular to this line at the distance of 8 inches from one end.

5. The three sides of a triangle are 16, 20, and 24 inches respectively ; it is required to lay it down by a scale of equal parts.

6. The base of a triangle measures 24, the distance of the perpendicular from one end of the base 14, and the perpendicular itself 12 inches ; it is required to lay down the triangle.

7. Lay down a square, whose side is 16 inches.

8. The length of a rectangle is 24, and its breadth 12 inches ; it is required to construct the figure.

9. Construct a regular rhombus whose side is 24 inches.

10. The base of an irregular rhombus measures 16, and the perpendicular breadth 12 inches ; it is required to construct the figure.

11. Lay down a regular rhomboid whose sides measure 36 and 18 inches respectively.

12. The transverse diameter of an ellipse, measures

28, and the conjugate 16 inches; it is required to construct the figure.

13. The side of a regular hexagon measures 14 inches; it is required to construct the figure.

14. It is required to make an acute angle that shall contain  $42^{\circ} 30'$ .

15. It is required to make an obtuse angle that shall contain  $136^{\circ} 45'$ .

## GEOMETRICAL THEOREMS,

THE

### DEMONSTRATIONS

OF WHICH

may be seen in the *Elements of Euclid, Simpson, and Emerson.*

#### THEOREM I.

If two straight lines  $AB$ ,  $CD$ , cut each other in the point  $E$ , the angle  $AEC$  will be equal to the angle  $DEB$ , and  $CEB$  to  $AED$ . (*Euclid I. 15. Simp. I. 8. Em. 2.*)

#### THEOREM II.

The greatest side of every triangle is opposite to the greatest angle. (*Enc. I. 18. Simp. I. 18. Em. II. 4.*)

## THEOREM III.

Let the right line  $E F$  fall upon the parallel right lines  $A B, C D$ ; the alternate angles  $A G H, G H D$ , are equal to each other; and the exterior angle  $E G B$ , is equal to the interior and opposite, upon the same side,  $G H D$ ; and the two interior angles  $B G H, G H D$ , upon the same side, are together equal to two right angles. (*Euc. I. 29. Simp. I. 7. Em. I. 4.*)

## THEOREM IV.

Let  $A B C$  be a triangle, and let one of its sides  $B C$  be produced to  $D$ ; the exterior angle  $A C D$  is equal to the two interior and opposite angles  $C A B, A B C$ ; also the three interior angles of every triangle are together equal to two right angles. (*Euc. I. 32. Simp. I. 9, 10. Em. II. 1, 2.*)

## THEOREM V.

Let the parallelograms  $A B C D, D B C E$  be upon the same base  $B C$ , and between the same parallels  $A E, B C$ ; the parallelogram  $A B C D$  is equal to the parallelogram  $D B C E$ . (*Euc. I. 35. Simp. II. 2. Em. III. 6.*)

## THEOREM VI.

Let the triangles  $ABC$ ,  $DBC$  be upon the same base  $BC$ , and between the same parallels  $AD$ ,  $BC$ ; the triangle  $ABC$  is equal to the triangle  $DBC$ . (*Enc. I. 37. p. II. 2. Em. II. 10.*)

## THEOREM VII.

Let  $ABC$  be a right angled triangle, having the right angle  $BAC$ ; the square of the side  $BC$  is equal to the sum of the squares of the sides  $AB$ ,  $AC$ . (*Enc. I. 47. p. II. 8. Em. II. 21.*)

*Pythagoras*, who was born about 2400 years ago, discovered a celebrated and useful theorem; in consequence of which, it is said, he offered a hecatomb to the gods.

## THEOREM VIII.

Let  $ABC$  be a circle, and  $BDC$  an angle at the cen-

tre, and  $BAC$  an angle at the circumference, which have the same arc  $BC$  for their base; the angle  $BDC$  is double of the angle  $BAC$ . (*Euc. III. 20. Simp. III. 10. Em. IV. 12.*)

### THEOREM IX.

Let  $ABC$  be a semicircle; then the angle  $ABC$  in that semicircle, is a right angle. (*Euc. III. 31. Simp. III. 13. Em. VI. 14.*)

### THEOREM X.

Let  $DE$  be drawn parallel to  $BC$ , one of the sides of the triangle  $ABC$ ; then  $BD$  is to  $DA$ , as  $CE$  to  $EA$ , (*Euc. VI. 2. Simp. IV. 12. Em. II. 12.*)

## THEOREM XI.

In the preceding figure,  $DE$  being parallel to  $BC$ , the angles  $ABC$ ,  $ADE$  are equiangular or similar; therefore  $AB$  is to  $BC$ , as  $AD$  to  $DE$ ; and  $AB$  is to  $AC$ , as  $AD$  to  $AE$ . (*Euc. VI. 4. Simp. IV. 12. Em. 13.*)

## THEOREM XII.

Let  $ABC$  be a right angled triangle, having the right angle  $BAC$ ; and from the point  $A$  let  $AD$  be drawn perpendicularly to the base  $BC$ ; the triangles  $ABD$ ,  $ADC$  are similar to the whole triangle  $ABC$ , and to one another. Also the perpendicular  $AD$  is a mean proportional between the segments of the base; and each of the sides is a mean proportional between the base and its segment adjacent to that side; therefore,  $BD$  is to  $DA$ , as  $DA$  to  $DC$ ;  $BC$  is to  $BA$ , as  $BA$  to  $BD$ ; and  $BC$  is to  $CA$ , as  $CA$  to  $CD$ . (*Euc. VI. 8. Simp. IV. 19. VI. 17.*)

## THEOREM XIII.

Let  $ABC$ ,  $ADE$  be similar triangles, having the angle  $A$  common to both; then the triangle  $ABC$  is to the triangle  $ADE$ , as the square of  $BC$  to the square of  $DE$ .

That is, similar triangles are to one another in the duplicate ratio of their homologous sides. (*Euc. VI. 19. IV. 24. Em. II. 18.*)

## THEOREM XIV.

In any triangle  $A B C$ , double the square of a line  $C D$ , drawn from the vertex to the middle of the base  $A B$ , together with double the square of half the base  $A D$  or  $B D$ , is equal to the sum of the squares of the other sides  $A C$ ,  $B C$ . (*Simp. II. 11. Em. II. 28.*)

## THEOREM XV.

In any parallelogram  $A B C D$ , the sum of the squares of the two diagonals  $A C$ ,  $B D$ , is equal to the sum of the squares of all the four sides of the parallelogram. (*Simp. II. 12. Em. III. 9.*)

## THEOREM XVI.

All similar figures are in proportion to each other as the squares of their homologous sides. (*Simp. IV. 26. Em. III. 20.*)

## THEOREM XVII.

The circumferences of circles, and the arcs and chords of similar segments, are in proportion to each other, as the radii or diameters of the circles. (*Em. IV. 8, 9.*)

## THEOREM XVIII.

Circles are to each other as the squares of their radii, diameters, or circumferences. (*Em. IV. 35.*)

## THEOREM XIX.

Similar polygons described in circles, are to each other, the circles in which they are inscribed; or as the squares of the diameters of those circles. (*Em. IV. 36.*)

## THEOREM XX.

All similar solids are to each other as the cubes of their like dimensions. (*Em. VI. 24.*)

## PART IV.

## MENSURATION OF SUPERFICIES,

## APPLIED TO

## GAUGING.

## PRELIMINARY OBSERVATIONS.

THE AREA of any plane figure is its superficial content, the measurement of its surface, without any regard to thickness. This area is computed from some space of a determined form; namely, from a square whose side is one inch, one foot, one yard, &c. which is thence called the measuring unit.

In the subject of Gauging, however, where the measuring unit is not a surface, but a solid, namely one ale gallon, one wine gallon, or one malt bushel, it is the universal custom, among Officers of the Excise, to consider every plane figure as a solid of one inch in depth or thick-

ness ; for, by this method, if we divide the number which expresses the area of any plane figure, in square inches, by the number of cubic inches contained in the *ale gallon*, the *wine gallon*, and the *malt bushel*, we shall obtain the *area*, or rather the *solid content* of the figure, at one inch deep, in ale and wine gallons, and malt bushels.

Now, as the design of Gauging is to determine the number of gallons, bushels, &c. contained in any vessel, or the number of gallons, bushels, &c. that any vessel is capable of containing, it is evidently most agreeable to the *general practice* of Gauging, to consider every plane figure as the base of some vessel, the sides of which are perpendicular to the bottom ; for having found the area of the base, we have only to multiply this area by the depth of the liquor in the vessel, or by the depth of the vessel, and we shall obtain the solid content, or capacity, in the same denomination in which the area is found.

By this method we enter directly on the *Practical Part* of Gauging ; and the learner will perceive the *real use* of the Science even in reading the first Problem.

## REMARKS.

By Chap. 28, Sec. 20, and Chap. 24, Sec. 34, of a Statute made in the 12th year of the reign of Charles II.; also by Chap. 24, Sec. 5, of another Statute made in the 1st year of the reign of William and Mary, "Every six and thirty gallons of beer taken by the gauge, according to the standard ale quart kept in the exchequer, four whereof shall make the gallon, shall be returned by the Gauger, within the limits of the bills of mortality, for a barrel of beer; and every two and thirty gallons of ale, taken by the gauge, according to the same standard, shall be returned by the Gauger, within the said limits, for a barrel of ale."

By Chap. 24, Sec. 5, of the last named Statute, "Every hundred and thirty gallons of beer or ale, whether strong or small, brewed out of the said limits, taken by the Gauger, according to the fore-mentioned standard, shall be returned by him for a barrel of beer or ale."

By Chap. 69, Sec. 12, of another Statute made in the third year of the reign of George III., "Every thirty-six gallons of beer or ale brewed by the common brewers in Great Britain, whether within or without the weekly bills mortality, taken according to the standard of the ale cart, four whereof shall make the gallon, remaining in the exchequer, shall be returned by the Gauger, for a barrel of beer or ale."

By Sec. 14, of the same Statute, "No beer or ale brewed by the common Brewers in Great Britain, shall be sold by them at any other rate or quantity for the barrel than thirty-six gallons; and that nothing herein shall extend to alter the quantity to be returned as and for a barrel of beer or ale brewed by any victualler or retailer, or any person other than the common brewer; but the same shall remain as declared by 1 W. and M. Chap. Sec. 5."

Note 1. Here it may be observed, that the standard ale quena, kept in the exchequer, contains  $70\frac{1}{2}$  cubic inches; and consequently the ale gallon is 282 cubic inches.

2. By this measure, Ale, Beer, and Porter are measured; and the computations in gauging these liquors, are made by it, in order to charge the Duty of Excise.

3. It may not be improper to observe, that if the area of any figure found in square inches, by the following Problems, and divided by the cubic inches in a pint, a quart, a gallon, a firkin, &c. &c., the respective quotients will be the area of the figure in pints, quarts, gallons, firkins, &c. &c.

4. The content of any vessel may be found in pints, quarts, gallons, &c. by dividing the content in cubic inches by the respective divisions. (See the foregoing and following Tables, for the cubic inches to a pint, quart, gallon, firkin, &c. &c.)

## TABLE VII.

*A Table of Wine and Spirit Measure.*

2	Pints .....	make	1 Quart, <i>qt.</i>
4	Quarts .....		1 Gallon, <i>gal.</i>
31½	Gallons .....		1 Barrel, <i>bar.</i>
42	Gallons .....		1 Tierce, <i>tier.</i>
63	Gallons .....		1 Hogshead, <i>hhd.</i>
84	Gallons .....		1 Puncheon, <i>pun.</i>
2	Hogsheads, or 126 Gallons .....		1 Pipe or butt, <i>pipe.</i>
2	Pipes, or 252 Gallons .....		1 Tun, <i>tun.</i>

## TABLE VIII.

*A Table of the Cubic Inches in a Pint, Quart, Gallon, &c. &c. Wine Measure.*

## Cubic Inches.

28.875 =	1 Pint.
57.750 =	2 = 1 Quart.
231 =	8 = 4 = 1 Gallon.
7276.5 =	252 = 126 = 81½ = 1 Barrel.
9702 =	336 = 168 = 42 = 1 Tierce.
14553 =	504 = 252 = 63 = 1½ = 1 Hogshead.
19404 =	672 = 336 = 84 = 2 = 1½ = 1 Puncheon.
29106 =	1008 = 504 = 126 = 3 = 2 = 1½ = 1 Pipe.
58212 =	2016 = 1008 = 252 = 6 = 4 = 3 = 2 = 1 Tun.

## REMARKS.

By Chap. 27, Sec. 17, of a Statute made in the 5th year of the reign of Queen Anne, it is enacted that, "Any round vessel, (commonly called a cylinder) having an even bottom, and being seven inches in diameter throughout, and six inches deep from the top of the inside to the bottom, or any vessel containing 231 cubic inches, shall be deemed a lawful wine gallon."

By the same Statute it is also enacted, "that 63 such gallons, each consisting of 231 cubic inches, shall be deemed a hogshead; 126 such gallons a butt or pipe; and 252 such gallons a tun of wine."

*Note 1.* By this measure all sorts of wines, spirits, distilled waters, cyder, perry, mead, verjuice, and vinegar, are measured; and Excise Officers make their computations by it, in gauging these liquors, in order to charge the duty.

2. An anker is 10, and a rundlet 18 gallons.

## TABLE IX.

*A Table of Corn or Dry Measure.*

Pints .....	make	1 Quart, qt.
Quarts .....		1 Gallon, gal.
Gallons .....		1 Peck, pk.
Pecks .....		1 Bushel, bu.
Bushels .....		1 Quarter, qr.
Quarters, or 40 Bushels .....		1 Wey, wey.
Weys, or 10 Quarters .....		1 Last, last.

## TABLE X.

*A Table of the Cubic Inches in a Pint, Quart, Gallon, &c. &c. Dry Measure.*

Cubic Inches.

33.6=	1 Pint.
67.2=	2= 1 Quart.
268.8=	8= 4= 1 Gallon.
537.6=	16= 8= 2= 1 Peck.
50.42=	64= 32= 8= 4= 1 Bushel.
103.36=	512= 256= 64= 32= 8= 1 Quarter.

1033.6=	5120= 2560= 640= 320= 80= 10= 2= 1 Last.

## REMARKS.

By Chap. 2, Sec. 7, of a Statute made in the 12th year of the reign of Queen Anne, and by Chap. 34, Sec. 4, of another Statute made in the 50th year of the reign of George III., it is enacted that, "Malt shall be charged the Winchester bushel; and every round vessel with even bottom, being made eighteen inches and a half in diameter throughout, and eight inches deep, shall be deemed a legal Winchester bushel."

By Chap. 2, Sec. 17, of the 12th of Anne, it is enacted that, "The Officers of the Excise shall take account of malt in making into malt, by gauge only, and not by actually measuring it with a bushel."

*Note 1.* If we determine the content of a cylindrical vessel whose diameter is 18½, and depth 8 inches, by Prob. 4, Part V., we shall

find it to be 2150.4252, the number of cubic inches in a Winchester bushel.

2. It has been ascertained by experiments, that after the saccharine substance has been extracted from malt, by the operation of mashing, its bulk is diminished a little more than one-sixth part of the whole, in consequence of which the mash-tun gallon is always taken at 236 cubic inches.

## TABLE XI.

*Avoirdupois Weight.*

16 Drams .....	make 1 Ounce	{ dr. oz. lb.
16 Ounces .....	1 Pound,	
28 Pounds .....	1 Quarter,	qr.
4 Quarters, or 112 lb, .....	1 Hundred Weight,	cwt.
20 Hundred Weight .....	1 Ton,	ton.

## TABLE XII.

*A Table of Drams in an Ounce, a Pound, a Quarter, &c. &c. Avoirdupois Weight.*

Drams.

16 = 1 Ounce.

256 = 16 = 1 Pound.

7168 = 448 = 28 = 1 Quarter.

28672 = 1792 = 112 = 4 = 1 Hund. Wt.

573440 = 35840 = 2240 = 80 = 20 = 1 Ton.

## REMARK.

By various Statutes made in the reign of George III., it is enacted that, "Officers of the Excise and Customs shall take the weight of candles, coffee, tea, cocoa-nuts, chocolate, glass, hides, hops, paper, salt, soap, starch, stone-bottles, tobacco, and snuff, by Avoirdupois Weight, in order to charge the respective duties upon these articles."

**THE METHOD OF FINDING THE  
MULTIPLIERS, DIVISORS, AND GAUGE-POINTS CONTAIN-  
ED IN THE SUBSEQUENT TABLE.**

If the area of any vessel, in square inches, be divided by the square-divisors 282, 231, 227, 268.8, and 2150.42,

## V.) THE METHOD OF FINDING FACTORS. 79

pective quotients will be the area of the vessel in  
ns, wine gallons, mash-tun gallons, malt gallons,  
lt bushels; but as dividing by these numbers is  
as multiplying by  $\frac{1}{282}$ ,  $\frac{1}{231}$ ,  $\frac{1}{227}$ , &c., it is evi-  
at if these fractions be reduced to decimals, we  
tain multipliers that will answer the same purpose  
divisors, if we prefer multiplication, in making our  
ons.

n, it has been found, by Mathematicians, that if  
meter of a circle be 1, the area will be .7854,  
and that the area of any circle may be obtained  
multiplying the square of the diameter by this num-  
ut as the area thus found, must be divided by the  
divisors, to reduce it to ale gallons, wine gallons,  
becomes desirable to find numbers that will per-  
e work at one operation.

, as multiplying the square of the diameter by  
and then dividing the product by the square-divi-  
the same thing as multiplying the square of the  
er by  $\frac{.7854}{282}$ ,  $\frac{.7854}{231}$ ,  $\frac{.7854}{227}$ , &c.; it is evident that if  
fractions be reduced to decimals, we shall obtain  
multipliers to be used in finding the areas of

we prefer division, it is the same thing to divide by  
 $\frac{231}{.7854}$ , &c. as to multiply by  $\frac{.7854}{282}$ ,  $\frac{.7854}{231}$ , &c.;  
, if those fractions be reduced to mixed numbers,  
all have proper divisors for circles.

the same manner we can find multipliers and divi-  
or ascertaining the weights of bodies from their con-  
and *vice versa*, provided the specific gravities of the  
s be known. Thus, the solid content of a pound  
rd soap cold, is found to be 27.14 cubic inches; a  
d of hard soap hot, 28.0; a pound of green soap,  
, &c. &c.; hence, if the area of any vessel, in  
re inches, be divided by these numbers, the respec-  
quotients will be the area of the vessel in pounds;  
if the area in pounds, be multiplied by the depth of  
vessel in inches, the product will be the content of the

vessel in pounds. Or, if the weight of any quarried goods, in pounds, be multiplied by the cubic inches per pound, the product will be the content in cubic inches.

The multipliers for squares, in order to find their contents in pounds, are found by reducing  $\frac{1}{27.14}$ ,  $\frac{1}{28.0}$ ,  $\frac{1}{25.67}$  to decimals; the multipliers for circles, by reducing  $\frac{.7854}{27.14}$ ,  $\frac{.7854}{28.0}$ ,  $\frac{.7854}{25.67}$ , &c. to decimals; and the divisors for circles, by reducing  $\frac{27.14}{.7854}$ ,  $\frac{28.0}{.7854}$ ,  $\frac{25.67}{.7854}$ , &c. to round numbers.

The gauge-points for squares are the square roots of the square-divisors; being the sides of squares whose areas are one ale gallon, one wine gallon, one malt bushel &c.; and the gauge-points for circles, are the square roots of the circular-divisors; being the diameters of circles whose areas are equal to one ale gallon, one wine gallon, one malt bushel, &c. &c.

*Note.* What has been said on this subject will be fully comprehended from the following Rules and Examples.

### *To find Multipliers for Squares.*

#### RULE.

Divide unity by the square divisors, and the respective quotients will be factors for squares.

#### EXAMPLES.

Divisors for Squares.	Multipliers for Squares.	
282)	1.000000	(.003546 Ale gallons.
231)	1.000000	(.004329 Wine gallons.
268.8)	1.000000	(.003720 Malt gallons.
227)	1.000000	(.00465 Malt bushels.
2150.42)	1.000000	(.004405 Mash-tun gallons.

*To find Multipliers for Circles.*

**RULE.**

Divide .7854 by the square-divisors, and the respective quotients will be factors for circles.

**EXAMPLES.**

Divisors for Squares.	Multipliers for Circles.
282)	.7854(.002785 Ale gallons.
281)	.7854(.003399 Wine gallons.
268.8)	.7854(.002922 Malt gallons.
227)	.7854(.000365 Malt bushels.
2150.42)	.7854(.00346 Mash-tun gallons.

*To find Divisors for Circles.*

**RULE.**

Divide the square-divisors by .7854, and the respective quotients will be divisors for circles.

**EXAMPLES.**

Area of a Circle whose Diameter is 1.	Divisors for Squares.	Divisors for Circles.
.7854)	282.0000(	359.05 Ale gallons.
.7854)	281.0000(	294.12 Wine gallons.
.7854)	268.8000(	342.24 Malt gallons.
.7854)	2150.4200(	2738.00 Malt bushels.
.7854)	227.0000(	289.00 Mash-tun gallons.

*To find Gauge-points for Squares.***RULE.**

Extract the square roots of the square-divisors, you will obtain the gauge-points for squares.

**EXAMPLES.**

Divisors for Squares.		Gauge-points for Squares.
282.00	} Their Square Roots are	16.79 Ale gallons.
231.00		15.19 Wine gallons.
268.80		16.39 Malt gallons.
2150.42		46.37 Malt bushels.
227.00		15.07 Mash-tun gallons.

*To find Gauge-points for Circles.***RULE.**

Extract the square roots of the circular divisors, and you will obtain the gauge-points for circles.

**EXAMPLES.**

Divisors for Circles.		Gauge-points, for Circles.
359.05	} Their Square Roots are	18.95 Ale gallons.
294.12		17.15 Wine gallons.
342.24		18.5 Malt gallons.
2738.		52.32 Malt bushels.
289.		17. Mash-tun gallons.

In the same manner were found all the Factors, Divisors, and Gauge-points in the following Table.

*of Factors, Divisors, and Gauge-points, for  
Squares and Circles.*

	Squares.	Circles.	Squares.	Circles.	Squares.	Circles.
Inches the area of unity	1	1.27324	1	1.128	1	1.128
A superficial foot	.006944	188.94	144.	13.54	12.	13.54
A solid foot	.000578	2200.16	1728.	46.91	41.37	46.91
Ale gallon	.003546	.008785	282.	18.95	16.79	18.95
Wine gallon	.004329	.008399	231.	17.15	15.19	17.15

The use of the Multipliers, Divisors, and Gauge-points, is the following Problems.

The figures, in the fourth column, of the above Table, are the Multipliers, except those in the first and second lines, which are the Divisors.

# PROBLEMS

## IN

# PRACTICAL GAUGING.

---

### PROBLEM I.

*The side of a square being given, to find the area in ale gallons, wine gallons, mash-tun gallons, and malt bushels.*

#### RULE.

*By the Pen.*

Multiply the length of one of the sides by itself, and the product will be the area in square inches; which being multiplied by .008546, .004329, .004405, and .000465; or divided by 282, 231, 227, and 2150.42, the respective products or quotients will be the area of the square in ale gallons, wine gallons, mash-tun gallons, and malt bushels.

*Note 1.* Excise Officers take their dimensions with measuring-tapes, divided into inches, or with gauging-rods, divided into inches and tenths.

2. If the area of the base of any vessel whose sides are perpendicular, be multiplied by the depth of the vessel, or by the depth of the liquor in the vessel, the product will be the solid content, or capacity, in the same denomination in which the area is found.

3. When the words *square guile-tun, rectangular cooler, &c. &c.* occur in this or the following Problems, it is to be understood that the bases of those vessels are squares, rectangles, &c. &c.; and it must always be remembered, that when we assign depths or thicknesses to squares or rectangles, they become *prisms, paralklopipedons, &c. &c.* (See Definitions Part V.)

#### EXAMPLES.

1. If the side of the square A B C D measure 105 inches; what is the area in ale, wine, and mash-tun gallons, and malt bushels?

*By the Sliding Rule.*

### RULE I.

In this operation the square divisors 282, 231, 227, 150.42, upon the line A, must be used; and the relation will be, As the square divisor on A, is to the area on B; so is the side on A, to the area on B.

$$\begin{array}{cccc}
 \text{On A.} & \text{On B.} & \text{On A.} & \text{On B.} \\
 \text{As } \left\{ \begin{array}{l} 282 \\ 231 \\ 227 \\ 2150.42 \end{array} \right\} & : 105 :: 105 : & \left\{ \begin{array}{l} 39.10 \text{ ale gallons.} \\ 47.73 \text{ wine gallons.} \\ 48.57 \text{ mash-tun gallons.} \\ 5.13 \text{ malt bushels.} \end{array} \right.
 \end{array}$$

## RULE II.

Set unity on C, to the square gauge-point on D ; then against the side of the square on D, is the area on C.

$$\begin{array}{cccc}
 \text{On D.} & \text{On C.} & \text{On D.} & \text{On C.} \\
 \text{As } \left\{ \begin{array}{l} 16.79 \\ 15.19 \\ 15.1 \\ 46.37 \end{array} \right\} & : 1 :: 105 : & \left\{ \begin{array}{l} 39.10 \text{ ale gallons.} \\ 47.73 \text{ wine gallons.} \\ 48.57 \text{ mash-tun gallons.} \\ 5.13 \text{ malt bushels.} \end{array} \right.
 \end{array}$$

2. Admit the foregoing figure to represent the base of a square guile-tun ; what quantity of ale does the vessel contain, when the depth of the liquor is 23.6 inches ?

$$\begin{array}{r}
 \text{Ale gallons.} \\
 39.1 \text{ area.} \\

 \hline
 \hline
 \end{array}$$

*By the Sliding Rule.*

## RULE I.

Multiply the area by the depth, and the product will be the content in ale gallons.

$$\begin{array}{cccc}
 \text{On A.} & \text{On B.} & \text{On A.} & \text{On B.} \\
 \text{As } 1 : 39.1 :: 23.6 : 922.76 \text{ ale gallons.}
 \end{array}$$

## RULE II.

Set the depth on C, to the square gauge-point on D ;

then against the side of the guile-tun on D, is the content on C.

On D. On C. On D. On C.  
As 16.79 : 23.6 :: 105 : 922.76 ale gallons.

3. The side of a square measures 153.4 inches ; required the area in ale and wine gallons, and malt bushels.

Ans. 88.443 ale gallons, 101.868 wine gallons, and 10.942 malt bushels.

4. If the side of a square cooler be 82.8 inches ; how many ale gallons does it contain, when the depth of the liquor is 5.4 inches ?

Ans. 129.384 ale gallons.

5. The side of a square wine-vat is 48.8 inches ; what is the content in wine gallons, when the depth of the liquor is 52.7 inches ?

Ans. 425.71 wine gallons.

6. The side of a square cistern measures 75 inches ; required the area and content in malt bushels, when the depth of the grain is 16.4 inches.

Ans. The area is 2.615, and the content 42.886 malt bushels.

7. The side of a square vessel measures 84 inches ; required the area and content in ale, wine, and mash-tun gallons, and malt bushels ; the depth being 14 inches.

Answer.

Areas.	Contents.
25.021.....	350.294 ale gallons.
30.545.....	427.630 wine gallons.
31.083.....	435.162 mash-tun gallons.
3.281.....	45.934 malt bushels.

#### REMARKS.

If the area of any figure, in square inches, be multiplied by .006944, the square factor for a superficial foot, taken from the second column of the foregoing Table, the product will be the area of the figure in square feet ; and if the area in square inches, be divided by 144, the square divisor, for a superficial foot, taken from the fourth column of the same Table, the quotient will also be the area in square feet.

The area of the first Example in this Problem, is 11025 square inches ; then,  $11025 \times .006944 = 76.5576$ ,

the area in square feet ; and  $11025 \div 144 = 76.562$ , which is also the area in square feet.

AGAIN, If the square of the diameter of a circle, or the product of the two diameters of an ellipse, be multiplied by .005454, the circular factor, for a superficial foot, taken from the third column of the foregoing Table, the product will be the area of the figure in square feet ; and if the same number be divided by 183.34, the circular divisor, for a superficial foot, taken from the fifth column of the same Table, the quotient will also be the area of the figure in square feet.

The square of the diameter of the circle in the first Example, Problem 13, is 1156 ; then,  $1156 \times .005454 = 6.304824$ , the area of the figure in square feet ; and  $1156 \div 183.34 = 6.305$ , which is likewise the area in square feet, as before.

It may also be observed that, if the area of any figure in square feet, be divided by 9, the number of square feet in a square yard, the quotient will be the area of the figure in square yards. (*For the Methods of measuring all kinds of Superficies and Solids, see Nesbit's Practical Mensuration.*)

## PROBLEM II.

*To find the area of a rectangle.*

### RULE.

*By the Pen.*

Multiply the length by the breadth, and the product will be the area in square inches ; which being divided by 282, 231, 227, and 2150.42, the respective quotients will be the area in ale gallons, wine gallons, mash-tun gallons, and malt bushels.

### EXAMPLES.

1. Required the area of the rectangle A B C D, in ale, wine, and mash-tun gallons, and malt bushels ; its length A B, being 102.5, and its breadth B C, 54.4 inches.

*By the Sliding Rule.*

As the square divisor on A, is to the length on B; so is the breadth on A, to the area on B.

	On A.	On B.	On A.	On B.
As {	282	: 102.5 :: 54.4 :	{	19.77 ale gallons.
	231			24.14 wine gallons.
	227			24.56 mash-tun gallons.
	2150.42			2.59 malt bushels.

2. If the foregoing figure represent the base of a rectangular vessel; what is its content in ale and wine gallons, and malt bushels, when its depth is 5.2 inches?

Here  $19.77 \times 5.2 = 102.804$  ale gallons;  $24.14 \times 5.2 = 125.528$  wine gallons; and  $2.59 \times 5.2 = 13.468$  malt bushels.

*By the Sliding Rule.*

one on A, is to the area on B ; so is the depth on A, content on B.

On A.	On B.	On A.	On B.
1 :	$\left\{ \begin{array}{l} 19.77 \\ 24.14 \\ 2.59 \end{array} \right\}$	:: 5.8 :	$\left\{ \begin{array}{l} 102.80 \text{ ale gallons.} \\ 125.53 \text{ wine gallons.} \\ 13.47 \text{ malt bushels.} \end{array} \right\}$

If the length of a rectangular cooler be 162.7, and width 86.8 inches ; how many gallons of ale does it hold, when the depth of the liquor is 6.8 inches ?

*Ans. 338.572 gallons.*

If the sides of a rectangular wine-vat measure 74.6 inches ; required the area and content, in wine gallons, supposing the depth of the liquor to be 24.7 in-

*The area is 21.217, and the content 524.0599 wine*

A brewer has a rectangular mash-tun which measures 4 inches in length, and 52 in breadth ; how many bushels of malt had been brewed, when the Excise Officer found the depth of the grains to be 32 inches ; adding that each gallon of malt uniformly produces one bushel of grains ? (See Note 2, Page 78.)

*Ans. 58.64 bushels.*

A maltster has a rectangular cistern whose length is 100 inches, and breadth 98.2 ; required the area and content, in malt bushels, when the depth is 14.8 inches.

*The area is 5.685, and the content 84.138 malt*

A floor of malt measures 245 inches in length, 152 inches in width, and 5.9 in depth ; required the area and content, in malt bushels.

*The area is 17.317, and the content 102.1703 malt*

## PROBLEM III.

*To find the area of, a rhombus or rhomboides.*

## RULE.

*By the Pen.*

Multiply the length of the base by the perpendicular breadth, and the product will be the area in square inches; which being divided by 282, 231, 227, and 2150.42, the respective quotients will be the area in ale wine, and mash-tun gallons, and malt bushels.

## EXAMPLES.

1. Let  $ABCD$  be a rhombus, whose base  $AB$  is 50 inches, and perpendicular  $DE$  40 inches; what is the area in ale, wine, and mash-tun gallons, and malt bushels?

*Inches.*

$$\begin{array}{r} 1935378 \\ \hline 646220 \\ 645126 \\ \hline 109400 \\ \hline \hline \end{array}$$

*By the Sliding Rule.*

Set the square divisor on A, as to the base on B; so is perpendicular breadth on A, to the area on B.

On A.	On B.	On A.	On B.
282	} : 50 :: 40 :	7.09	ale gallons.
231		8.66	wine gallons.
227		8.81	mash-tun gallons.
150.42		0.93	malt bushels.

2. Let the foregoing figure denote the base of a vessel whose sides are perpendicular; required the content in ale, wine, mash-tun gallons, and malt bushels, at 17 inches from the bottom?

Here  $7.092 \times 17 = 120.564$  ale gallons;  $8.658 \times 17 = 147.186$  wine gallons;  $8.81 \times 17 = 149.77$  mash-tun gallons; and  $.93 \times 17 = 15.81$  malt bushels.

*By the Sliding Rule.*

As one on A, is to the area on B; so is the depth on A, to the content on B.

On A.	On B.	On A.	On B.
As 1 :	$\left\{ \begin{array}{l} 7.09 \\ 8.66 \\ 8.81 \\ 0.93 \end{array} \right\}$	:: 17 :	$\left\{ \begin{array}{l} 120.56 \text{ ale gallons.} \\ 147.19 \text{ wine gallons.} \\ 149.77 \text{ mash-tun gallons.} \\ 15.81 \text{ malt bushels.} \end{array} \right\}$

3. There is a cooler in the form of a rhomboid, whose base is 73.6, and perpendicular breadth 56.2 inches; required the area and content, in ale gallons; the depth of the liquor being 2.7 inches?

*Ans. The area is 14.667, and the content 39.6009 gallons.*

4. Required the area and content of a rhomboid vessel, in ale gallons, the length of the base being 108 inches, the perpendicular breadth 70.6, and the depth of the liquor eight-tenths of an inch.

*Ans. The area is 27.138, and the content 21.7104 gallons.*

#### PROBLEM IV.

*To find the area of a triangle, when the base and perpendicular are given.*

#### RULE.

*By the Pen.*

Multiply the base by the perpendicular, and half the product will be the area in square inches; which being divided by 282, 231, and 2150.42, the respective quotients will be the area in ale and wine gallons, and malt-bushels.

*Note.* If the base be multiplied by half the perpendicular, or the perpendicular by half the base, the product will be the area in square inches.

## EXAMPLES.

1. Required the area of the triangle A B C, in ale and wine gallons, and malt bushels; the base A B, being 216.8, and the perpendicular D C, 94.6 inches.

*Note.* The perpendicular C D, is the shortest distance from the angle C, to the base A B; and may be found by one person holding the end of the measuring-tape at C, while another, by trials, determines the point D.

 \end{array}$$

*By the Sliding Rule.*

As the square divisor on A, is to the base on B; so is half the perpendicular on A, to the area on B.

	On A.	On B.	On A.	On B.	
As	{	:	216.8 ::	47.3 :	
				{	36.36 ale gallons.
				{	44.39 wine gallons.
	{			4.77 malt bushels.	

2. If the foregoing figure represent the base of a triangular vessel; how many ale gallons, wine gallons, and malt bushels will it contain, if its depth be 21.6 inches?

Here  $36.368 \times 21.6 = 785.4408$  ale gallons;  $44.392 \times 21.6 = 958.8672$  wine gallons; and  $4.768 \times 21.6 = 102.9888$  malt bushels.

*By the Sliding Rule.*

As one on A, is to the area on B; so is the depth on A, to the content on B.

On A.	On B.	On A.	On B.
1 :	$\left\{ \begin{array}{l} 36.36 \\ 44.39 \\ 4.77 \end{array} \right\}$	:: 21.6 :	$\left\{ \begin{array}{l} 785.44 \text{ ale gallons.} \\ 958.87 \text{ wine gallons.} \\ 102.98 \text{ malt bushels.} \end{array} \right\}$

The base of a triangular cooler measures 124, and perpendicular 94.7 inches; required the area and content in ale gallons, when the depth of the liquor is 4 inches.

s. The area is 20,82, and the content 85.362 ale gallons.

A maltster has a triangular cistern the base of which measures 186.7, and the perpendicular 86.8 inches; required its area and content, in malt bushels, when the depth of the grain is 42.3 inches.

s. The area is 2.758, and the content 116.6634 malt bushels.

PROBLEM V.

*Find the area of a triangle when the three sides are given.*

RULE.

*By the Pen.*

From half the sum of the three sides subtract each side severally; multiply the half sum and the three remainders continually together; and the square root of the last product will be the area in square inches. Divide this area by 282, 231, and 2150.42, and you will have the area in ale and wine gallons, and malt bushels.

EXAMPLES.

What is the area of the triangle A B C, in ale and wine gallons, and malt bushels?

K 2

$2.127 \times 8.6 = 18.2922$  ale gallons;  $2.597 \times 8.6 = 22.33$  wine gallons; and  $2.79 \times 8.6 = 2.3994$  malt bushels.

*By the Sliding Rule.*

As the depth on A, is to the area on B; so is the depth on B, to the area on A.

On A.	On B.	On A.	On B.
1	$\left\{ \begin{array}{l} 2.13 \\ 2.60 \\ .28 \end{array} \right\}$	$:: 8.6 :$	$\left\{ \begin{array}{l} 18.29 \text{ ale gallons.} \\ 22.33 \text{ wine gallons} \\ 2.40 \text{ malt bushels.} \end{array} \right\}$

As the three sides of a triangle measure 114, 112, and 110 respectively; what is its area in ale and wine gallons, and malt bushels?

*The area is 17.689 ale gallons; 21.594 wine gallons, and 2.319 malt bushels.*

The base of a guile-tun is an equilateral triangle whose side is 74 inches; required the area and content in ale gallons, when the depth of the liquor is 28.6 inches.

*The area is 8.408, and the content 240.4688 ale gallons.*

The first question in this Problem being a right-angled triangle, may be more easily solved by the Rule given in the last Problem; and the fourth question being an equilateral triangle, may be solved by Problem the tenth; the Rule given in this Problem is, however, particularly useful in finding the areas of oblique angled isosceles and scalene triangles, when their sides only are given; and also in determining the area of a trapezium from the lengths of its sides, and one of the diagonals.

## PROBLEM VI.

*To find the area of a trapezium.*

### RULE.

*By the Pen.*

Multiply the sum of the two perpendiculars by the distance between them, and half the product will be the area in square inches. Divide the area thus found, by 128, and 2150.42, and the respective quotients will be the area of the figure in ale and wine gallons, and malt bushels.

*Note 1.* The area of a trapezium may also be found by dividing into two triangles, and computing the area of each triangle either of the last Problems.

2. Sometimes a trapezium may be very properly divided into two right-angled triangles and a trapezoid.

## EXAMPLES.

1. What is the area of the trapezium A B C D, in ale and wine gallons, and malt bushels; the diagonal A C measuring 121 inches, and the perpendiculars B E, and D F, 38.3 and 43.1 inches respectively?

*Inches.*

38.3 }  
43.1 } *perpendiculars.*

What is the area of the following trapezium, in ale; A B measuring 130.5, D E 46.4, B D 97, and 6 inches?

This figure is divided into two triangles, because two perpen. cannot be taken upon either of the diagonals.

$130.5 \times 46.4 \div 2 = 6055.20 \div 2 = 3027.60$ , the area triangle A B D; and  $97 \times 24.6 \div 2 = 2386.2 \div 2 = 1193.1$ , the area of the triangle B C D; then  $3027.60 + 1193.1 = 4220.7$  square inches, the area of the trapezium D; whence  $4220.7 \div 282 = 14.967$ , the area in ale

*By the Sliding Rule.*

he square divisor on A, is to the base on B; so the perpendicular on A, to the area on B.

*By the Sliding Rule.*

he square divisor on A, is to the base or perpendi-  
 stance of the sides on B; so is half the sum of  
 es on A, to the area on B.

	On A.	On B.	On A.	On B.
As	$\left\{ \begin{array}{l} 282 \\ 231 \\ 2150.42 \end{array} \right\}$	:	151.5 :: 85.2 :	$\left\{ \begin{array}{l} 45.77 \text{ ale gallo} \\ 55.88 \text{ wine gal} \\ 6.00 \text{ malt bus} \end{array} \right\}$

2. Let the following figure represent a floor of malt, how many bushels does it contain, when the parallel sides A B and D C measure 186 and 112 respectively; D the perpendicular distance between them, 106; and depth of the grain 5.7 inches?

Here  $186 + 112 \times 106 = 298 \times 106 = 31588$ ; and  $31588 \div 2 = 15794$ , the area in square inches; also  $15794 \div 2150.42 = 7.344$ , the area in malt bushels; then  $7.344 \times 5.7 = 41.8608$ , the number of bushels required.

### By the Sliding Rule,

Find the area as in the last example; then as one side on A, is to the area on B; so is the depth on A, to the content on B.

	On A.	On B.	On A.	On B.
As	2150.42	: 106 ::	149	: 7.34, the area; then,
As	1	: 7.34 ::	5.7	: 41.86, the content.

Or,

Without knowing the area, the content may be found by the line marked M D, thus; As the perpendicular distance of the sides on B, is to the depth on M D; so is half the sum of the sides on A, to the content on B.

	On B.	On M D.	On A.	On B.
As	106	: 5.7 ::	149	: 41.86, the content.

3. The base of a cooler is a trapezoid whose parallel sides measure 214 and 178 respectively; and the perpendicular distance between them 146 inches; what is the area in ale gallons? *Ans.* 101.475 ale gallons.

4. If the depth of the liquor, in the foregoing cooler, be one inch and seven-tenths; how many ale gallons does it contain? *Ans.* 172.5075 ale gallons.

### PROBLEM VIII.

*To find the area of an irregular polygon of any number of sides.*

#### RULE.

*By the Pen.*

Divide the given figure into triangles and trapeziums, in the most convenient manner; and find the area of each separately by the foregoing Problems; then the sum of these areas will be the area of the polygon in square inches. Divide the area thus found by 282, 231, and 2150.42, and you will obtain the area of the figure in ale and wine gallons, and malt bushels.

*Note 1.* It is sometimes more eligible to find the double area of each figure into which the polygon is divided; and half the sum of these double areas will be the area of the polygon.

2. Sometimes the area of an irregular figure may be very easily found by measuring a base line in a convenient position; and upon it erecting perpendiculars to the opposite angles, on each side, thus dividing the whole figure into right-angled triangles and trapezoids. (See Example 4.)

#### EXAMPLES.

1. Required the area of the irregular polygon A B C D E F G, in ale and wine gallons, and malt bushels, from the following dimensions.

**Diagonals.****Inches.**

$A m = 75.0$	}
$A B = 106.5$	
$A o = 36.0$	}
$A n = 74.4$	
$A D = 108.0$	}
$D p = 48.0$	
$D r = 70.5$	}
$D F = 102.0$	

**Perpendiculars.****Inches.**

$C m = 24.0$	}
$G o = 22.5$	
$C n = 25.8$	}
$E p = 31.2$	
$G r = 27.6$	}

**CONSTRUCTION.** Draw the line  $A B$ , which  $m a = 106.5$ ; and lay off  $75.0$  from  $A$  to  $m$ , at which point erect the perpendicular  $C m = 24.0$ ; and join  $A C$  and  $B C$  and you will have the triangle  $A B C$ .

With  $C$  as a centre, and the radius  $C n = 25.8$ , describe an arc; and with  $A$  as a centre, and the radius  $A n = 74.4$ , describe another arc cutting the former in  $n$ . Through the point  $n$  draw the diagonal  $A D = 108.0$ , upon which lay off  $A o = 36.0$ . At  $o$  erect the perpendicular  $G o = 22.5$ ; join  $C D$ ,  $D G$ , and  $G A$ , and the trapezium  $A C D G$  will be completed.

The trapezium  $D E F G$  may be constructed in a similar manner.

**CALCULATION.** Here  $106.5 \times 24 = 2556$ , double the area of the triangle  $A B C$ .

Again,  $22.5 + 25.8 \times 108 = 48.3 \times 108 = 5216.4$  double the area of the trapezium  $A C D G$ .

Also,  $31.2 + 27.6 \times 102 = 58.8 \times 102 = 5997.6$ , double the area of the trapezium  $D E F G$ .

$$\frac{2556 + 5216.4 + 5997.6}{2} = \frac{13770}{2} = 6885 \text{ square in.}$$

area of the irregular polygon *A B C D E F G*.

6885 ÷ 282 = 24.414, the area in ale gallons ;  
6885 ÷ 29.4 = 234.184, the area in wine gallons ; and 6885 ÷ 3.201 = 2150.89, the area in malt bushels.

### By the Sliding Rule.

In this operation, recourse must be had to the Rules Problems IV. and VI.

#### Ale Measure.

On B.	On A.	On B.
$\left\{ \begin{array}{l} 106.5 \\ 108.0 \\ 102.0 \end{array} \right\}$	$\left\{ \begin{array}{l} 12.0 \\ 24.15 \\ 29.4 \end{array} \right\}$	$\left\{ \begin{array}{l} 4.53 \text{ triangle } A B C. \\ 9.25 \text{ trapezium } A C D G. \\ 10.63 \text{ trapezium } D E F G. \\ \hline 24.41 \text{ whole polygon.} \end{array} \right.$

#### Wine Measure.

On B.	On A.	On B.
$\left\{ \begin{array}{l} 106.5 \\ 108.0 \\ 102.0 \end{array} \right\}$	$\left\{ \begin{array}{l} 12.0 \\ 24.15 \\ 29.4 \end{array} \right\}$	$\left\{ \begin{array}{l} 5.53 \text{ triangle } A B C. \\ 11.29 \text{ trapezium } A C D G. \\ 12.98 \text{ trapezium } D E F G. \\ \hline 29.80 \text{ whole polygon.} \end{array} \right.$

#### Malt Measure.

On B.	On A.	On B.
$\left\{ \begin{array}{l} 106.5 \\ 108.0 \\ 102.0 \end{array} \right\}$	$\left\{ \begin{array}{l} 12.0 \\ 24.15 \\ 29.4 \end{array} \right\}$	$\left\{ \begin{array}{l} 0.59 \text{ triangle } A B C. \\ 1.21 \text{ trapezium } A C D G. \\ 1.39 \text{ trapezium } D E F G. \\ \hline 3.19 \text{ whole polygon.} \end{array} \right.$

If the foregoing figure represent the base of a vessel, what quantity of ale does the vessel contain, if the depth of the liquor is 6.7 inches?

Ans. 163.5738 ale gallons.

L

3. Required the area of an irregular polygon in ale and wine gallons, and malt bushels; the first side measuring 94, the second 102, the third 64, the fourth 140, and the fifth 100 inches; and the diagonal from the first to the third angle 160, and that from the first to the fourth 130 inches.

*Note.* This figure is divided into three triangles; the areas of which may be found by Problem 5.

*Ans.* The area is 52.336 ale gallons, 63.890 wine gallons, and 6.863 malt bushels.

4. Required the area of the following irregular figure, in ale and wine gallons, and malt bushels; all the dimensions being taken in inches.

	AB	
0	1314	126
234	1005	
	980	52
	785	125
312	700	
	555	152
215	460	
	335	100
336	260	
360	000	232
Begin at A,	and	measure to B.

*Note 1.* The dimensions of the foregoing figure, are taken as directed in Note 2; and evidently divide the figure into one right-angled triangle, and nine trapezoids. The base line is measured from A to B; the dimensions are entered from the bottom towards the top; the point on the base line, where each perpendicular rises to the opposite

angle, is entered in the middle column; and the perpendiculars themselves in the right and left-hand columns respectively. The base of each trapezoid may be found by subtracting the distances on the base line from each other; thus, the base of the first trapezoid on the left, is 260; the base of the first on the right, 335; the base of the second on the left,  $460 - 260 = 200$ ; the base of the second on the right,  $555 - 335 = 220$ , &c. &c.

2. When the dimensions are numerous, the foregoing method of entering them in the Note Book, will be found very convenient; if, however, a rough sketch of the figure be preferred, it may be drawn, and the dimensions entered upon the respective parts of the figure.

### Answer.

#### Double Areas.

324337 trapezoids on the right.

656476 ditto on the left.

2)980813 sum.

490406 area in square inches.

Then,  $490406 \div 282 = 1739.028$ , the area in ale gallons;  
 $490406 \div 231 = 2122.969$ , the area in wine gallons; and  
 $490406 \div 2150.42 = 228.051$ , the area in malt bushels.

### REMARK.

When any side of an irregular figure is curved, draw a chord-line so as to join the extremities of the curve; and erect perpendiculars from the chord-line to the curve, in such a manner as to divide the space contained between the chord and the curve into a number of small right-angled triangles and trapezoids, the areas of which must be found as in the last Example. Or the area of the space contained between the chord and the curve may be found by the method of Equi-distant Ordinates, described in Problem XX.

## PROBLEM IX.

*To find the area of a regular polygon.*

### RULE.

*By the Pen.*

Multiply the sum of the sides, or perimeter of the

polygon, by the perpendicular falling from its centre upon one of the sides; and half the product will be area in square inches. Divide this area by 282, 231, 2150.42, and the respective quotients will be the area in ale and wine gallons, and malt bushels.

*Note.* The sum of the sides may be obtained by multiplying length of one side by the number of sides.

## EXAMPLES.

1. Required the area of the regular hexagon A B C D E F, in ale and wine gallons, and malt bushels; the side A B being 41.2, and the perpendicular P o 35.6 inches

*Inches.*

41.2 side.

6 number of sides.

Required the area and content of a hexagonal guile-ale gallons; the side of the vessel measuring 21.7 depth 41.6 inches.

*The area is 4.3383, and the content 180.47328 ale*

What is the area, in wine gallons, of a heptagonal at whose side measures 24.3 inches?

*Ans. 9.2889 wine gallons.*

If the side of an octagonal cistern measures 31.2 what is the area in malt bushels?

*Ans. 2.1853 malt bushels.*

PROBLEM XI.

On the diameter of a circle to find the circumference; or, the circumference to find the diameter.

RULE I.

*By the Pen.*

7 is to 22, so is the diameter to the circumference: 22 is to 7, so is the circumference to the diameter.

RULE II.

Multiply the diameter by 3.1416, and the product will be the circumference: or, divide the circumference by 3.1416, and the quotient will be the diameter.

The second Rule is more correct than the first, and is therefore generally preferred.

## EXAMPLES.

1. If the diameter A B of a circle be 84.5 inches, what is the circumference?

*By Rule I.*

*As 7 : 22 :: 84.5 : 265.571 inches, the circumference required.*

*By Rule II.*

*Here  $3.1416 \times 84.5 = 265.4652$  inches, the circumference required.*

*By the Sliding Rule.*

## RULE I.

As 7 on A, is to 22 on B; so is the diameter on A, the circumference on B: and as 22 on B, is to 7 on A, so is the circumference on B, to the diameter on A.

On A.    On B.    On A.    On B.

*As 7 : 22 :: 84.5 : 265.57 inches, the circumference required.*

## RULE II.

As 1 on A, is to 3.1416 on B; so is the diameter on A to the circumference on B; and vice versa.

On A.    On B.    On A.    On B.

*As 1 : 3.1416 :: 84.5 : 265.46 inches, the circumference required.*

2. The circumference of a circle is 265.4652 inches, what is the diameter? *Ans. 84.5 inches.*

3. The diameter of a cylindrical vessel is 36.9 inches, what is its circumference? *Ans. 115.935 inches.*

The circumference of a globe or sphere is 86.7 in-  
what is its diameter? *Ans. 27.5974 inches.*

There is no figure that affords a greater variety of useful pro-  
than the circle; nor is there any that contains so large an area  
the same perimeter.

ratio of the diameter of a circle to its circumference has never  
exactly determined; although this celebrated Problem, called  
ring of the circle, has engaged the attention and exercised the  
of the ablest Mathematicians, both ancient and modern. But  
the relation between the diameter and circumference cannot be  
efined in known numbers; yet approximating ratios have been  
ed sufficiently correct for practical purposes.

nedes, a native of Syracuse, who flourished about 200 years  
e Christian era, after attempting in vain to determine the true  
the diameter to the circumference, found it to be nearly as 7

proportion given by Vieta, a Frenchman, and Metius, a Dutch-  
out the end of the 16th century, is as 113 to 355, which is  
ore accurate than the former; and is a very commodious ratio,  
reduced into decimals, it agrees with the truth to the sixth  
clusively.

irst, however, who ascertained this ratio to any great degree  
ness, was Ludolph Van Ceulen, a Dutchman. He found  
the diameter of a circle be 1, the circumference will be  
2653589793238462643383279502884 nearly, which is true to  
s of decimals. This was thought so extraordinary a perform-  
at the numbers were cut on his tomb-stone, in St. Peter's  
yard, at Leyden.

the invention of fluxions, by the illustrious Sir Isaac Newton,  
ring of the circle has become more easy; and the late ingeni-  
Abraham Sharp, of Little Horton, near Bradford, in York-  
as not only confirmed Ceulen's ratio, but extended it to 72  
f decimals.

John Machin, Professor of Astronomy in Gresham College,  
, has also given us a quadrature of the circle, which is true to  
ces of figures; and even this has been extended, by the French  
aticians, to 128.

## PROBLEM XII.

*To find the length of the arc of a circle.*

### RULE I.

*By the Pen.*

From 8 times the chord of half the arc subtract the

Also,  $1156 \times .003399 = 3.929244$ , the area in wine gallons;  $1156 \times .00346 = 3.99976$ , the area in mash-tun gallons; and  $1156 \times .000365 = .421940$ , the area in malt bushels.

*By Division.*

$$\begin{array}{r}
 \text{Sq. of diameter.} \\
 \text{Divisor } 359.05 \overline{) 1156.00} (3.2196 \text{ ale gallons.} \\
 \underline{107715} \\
 78850 \\
 \underline{71810} \\
 70400 \\
 \underline{35905} \\
 344950 \\
 \underline{328145} \\
 218050 \\
 \underline{215430} \\
 2620 \\
 \hline
 \hline
 \end{array}$$

Also,  $1156 \div 294.12 = 3.9303$ , the area in wine gallons;  $1156 \div 289 = 4.0$ , the area in mash-tun gallons; and  $1156 \div 2738 = .4222$ , the area in malt bushels.

*By the Table of Ale Areas, in Part VII.*

Find the diameter 34, in the first or left-hand column; and opposite to it, in the second column, you will have 3.2196, the area in ale gallons.

*By the Table of Wine Areas, in Part VII.*

Having found the diameter 34, in the first column; opposite to it, in the second column, we have 3.9304, the area in wine gallons.

*By the Sliding Rule.*

### RULE I.

As the circular divisor on A, is to the diameter on B; so is the diameter on A, to the area on B.

On A.	On B.	On A.	On B.
59.05	} : 34 :: 34 :	3.22	ale gallons.
24.12		3.93	wine gallons.
39.0		4.00	mash-tun gallons.
18.0		.422	malt bushels.

## RULE II.

ircular gauge-point on D, is to unity on C; so  
meter on D, to the area on C.

On D.	On C.	On D.	On C.
18.95	} : 1 :: 34 :	3.22	ale gallons.
17.15		3.93	wine gallons.
17.07		4.00	mash-tun gallons.
52.32		.422	malt bushels.

diameter of a circle is 215.8 inches, what is the  
: and wine gallons?

*By Multiplication.*

$215.8 \times 215.8 \times .002785 = 46569.64 \times .002785 =$   
174, the area in ale gallons; and  $46569.64 \times$   
 $= 158.29020686$ , the area in wine gallons.

*By Division.*

$46569.64 \div 359.05 = 129.7023$ , the area in ale gal-  
lons;  $46569.64 \div 294.12 = 158.3355$ , the area in wine

*See Tables of Ale and Wine Areas, in Part VII.*

ing found 215 in the first column of the Table of  
s, and .8 at the top of the page; then in the  
angle of meeting, we have 129.7011, the area in  
ns.

proceeding in the same manner with the Table of  
eas, we obtain 158.3867, the area in wine gallons.

M

*By the Sliding Rule.*

**RULE I.**

$$\begin{array}{ccccccc} & \text{On A.} & & \text{On B.} & & \text{On A.} & & \text{On B.} \\ \text{As } \left\{ \begin{array}{l} 359.05 \\ 294.12 \end{array} \right\} & : & 215.8 & :: & 215.8 & : & \left\{ \begin{array}{l} 129.70 \text{ ale gallon} \\ 158.34 \text{ wine gallon} \end{array} \right\} \end{array}$$

**RULE II.**

$$\begin{array}{ccccccc} & \text{On D.} & & \text{On C.} & & \text{On D.} & & \text{On C.} \\ \text{As } \left\{ \begin{array}{l} 18.95 \\ 17.15 \end{array} \right\} & : & 1 & :: & 215.8 & : & \left\{ \begin{array}{l} 129.70 \text{ ale gallons.} \\ 158.34 \text{ wine gallons.} \end{array} \right\} \end{array}$$

3. If the circle, in the last question, be the base of cylindrical guile-tun; how many gallons of ale does the vessel contain, when the depth of the liquor is 48.6 inches?

*Ale Gallons.*

129.7011 *area.*

48.6 *depth.*

$$\begin{array}{r} 7782066 \\ 10376088 \\ 5188044 \\ \hline 6303.47346 \text{ Ans.} \end{array}$$

*By the Sliding Rule.*

As 1 on A, is to the area on B; so is the depth on A to the content on B.

$$\begin{array}{ccccccc} & \text{On A.} & & \text{On B.} & & \text{On A.} & & \text{On B.} \\ \text{As } 1 & : & 129.7 & :: & 48.6 & : & 6303.47, \text{ ale gallons.} \end{array}$$

4. The diameter of a circle is 38.6 inches, what is its area in ale, wine, and mash-tun gallons, and malt bushels?

*Ans. By Multiplication, the area is 4.1280 ale gallons 5.0381 wine gallons; 5.1285 mash-tun gallons; and .541 malt bushels.*

5. If the diameter of a cylindrical wine-vat be 78.6 inches, what is the area of its base, in wine gallons?

*Ans. By Division, the area is 21.0048; and by the table of wine areas, 21.005 wine gallons.*

6. The diameter of a cylindrical vessel is 58.2 inches, required its area and content in ale gallons, when the depth of the liquor is 35.7 inches.

*Ans. By Multiplication, the area is 7.8822, and the content 281.39454 ale gallons.*

## GENERAL RULES.

The following Rules will solve most of the useful Problems relating to the circle and its equal or inscribed square, &c.

**RULE 1.** The diameter of a circle multiplied by .8862269, will give the side of a square equal in area.

2. The circumference of a circle multiplied by .2820948, will give the side of a square equal in area.

3. The diameter of a circle multiplied by .7071068, will give the side of the inscribed square.

4. The circumference of a circle multiplied by .2250791, will give the side of the inscribed square.

5. The area of a circle multiplied by .6366197, and the square root of the product extracted, will give the side of the inscribed square.

6. The side of a square multiplied by 1.414214, will give the diameter of its circumscribing circle.

7. The side of a square multiplied by 4.442883, will give the circumference of its circumscribing circle.

8. The side of a square multiplied by 1.128379, will give the diameter of a circle equal in area.

9. The side of a square multiplied by 3.544908, will give the circumference of a circle equal in area.

## PROBLEM XIV.

*To find the area of the sector of a circle.*

### RULE.

*By the Pen.*

Multiply the length of the arc by the radius of the

sector, and half the product will be the area in square inches; which being divided by 282, 231, and 2150.42, the respective quotients will be the area in ale and wine gallons, and malt bushels.

*Note 1.* The length of the arc may be found by Problem XII.

2. The area of a quadrant may be obtained by taking  $\frac{1}{4}$ , and the area of a semi-circle by taking  $\frac{1}{2}$  of the area of the whole circle.

#### EXAMPLES.

1. What is the area of the sector A B C D, in ale gallons, when the radius A B or A D measures 45, the chord B D of the whole arc 72, and the versed sine C E 18 inches?

Here  $\sqrt{36^2 + 18^2} = \sqrt{1296 + 324} = \sqrt{1620} = 40.2492$   
 $= DC$ , the chord of half the arc; and  $\frac{40.2492 \times 8 - 72}{3} =$   
 $\frac{321.9936 - 72}{3} = \frac{249.9936}{3} = 83.3312$ , the length of the arc  
 $DCB$ ; then  $\frac{83.3312 \times 45}{2} = \frac{3749.904}{2} = 1874.952$ , the area  
 in square inches; whence  $\frac{1874.952}{282} = 6.648$ , the area in ale  
 gallons.

*By the Sliding Rule.*

As the square divisor on A, is to the radius of the sector on B; so is half the length of the arc on A, to the area on B.

On A.	On B.	On A.	On B.
As 282	: 45	:: 41.66	: 6.65 alc gallons.

2. The radius of a sector is 31.5, and the length of the arc 42.6 inches; what is its area in wine gallons?

*Ans.* 2.9045 wine gallons.

3. The radius of a sector is 60, and the chord of the whole arc 72 inches; what is its area in malt bushels?

*Ans.* 1.0768 malt bushels.

4. The radius of a cooler, placed in an oblique angle of a brew-house, measures 80, the chord of the whole arc 124.8, and the chord of half the arc 69.3 inches; required the area and content in ale gallons, when the depth of the liquor is 8.7 inches.

*Ans.* The area is 20.312, and the content 176.7144 ale gallons.

### PROBLEM XV.

*To find the area of the segment of a circle.*

#### RULE I.

*By the Pen:*

To two thirds of the product of the chord and height of the segment, add the cube of the height divided by twice the chord, and the sum will be the area in square inches. Divide this area by 282, 231, and 2150.42, and the respective quotients will be the area in ale and wine gallons, and malt bushels.

*Note 1.* If the segment be greater than a semi-circle, find the area of the remaining segment, which subtract from the area of the whole circle; and the remainder will be the area of the segment required.

2. When the chord and versed sine are given, divide the square of the chord by the versed sine; to the quotient add the versed sine, and the sum will be the diameter of the circle; hence its area may be found by Prob. 13. Or, multiply the square of the diameter by .7854, and the product will be the area in square inches; from this take the area of the remaining segment, and the difference will be the area of the segment required, in square inches.

#### EXAMPLES.

1. The chord A B measures 120, and the versed sine M 3

CE 30 inches; what is the area of the segment A C B, ale and wine gallons, and malt bushels?

Here  $120 \times 30 \times \frac{1}{3} = 3600 \times \frac{1}{3} = \frac{7200}{3} = 2400$ , two-thirds of the product of the chord and versed sine, or height of segment; and  $\frac{30^3}{120 \times 2} = \frac{27000}{240} = 112.5$ , the cube of height divided by twice the chord; then  $2400 + 112.5 = 2512.5$ , the area in square inches; whence,  $2512.5 \div 282 = 8.9095$ , the area in ale gallons;  $2512.5 \div 231 = 10.876$ , the area in wine gallons; and  $2512.5 \div 2150.42 = 1.168$ , the area in malt bushels.

2. The chord A B is 128, and the versed sine C E 30 inches; what is the area of the segment in ale and wine gallons?

*Ans.* The area is 10.137 ale, and 12.375 wine gallons.

3. Required the area of the segment A D B, greater than a semi-circle, in ale and wine gallons, and malt bushels; the chord A B measuring 60, and the versed sine E D 40 inches.

*Ans.* 7.351 ale gallons, 8.974 wine gallons, and .964 malt bushels.

## RULE II.

Divide the versed sine or height of the segment by the diameter of the circle of which the segment is a part and find the quotient in the column of heights or versed sines, in the Table at the end of Part IV.

Take out the corresponding Area Seg. which multiply

by the square of the diameter; and the product will be the area of the segment in square inches. Divide the area thus obtained by 282, 231, and 2150.42, and the respective quotients will be the area in ale and wine gallons, and malt bushels.

*Note 1.* If the quotient of the height by the diameter do not terminate in three places of figures, without a fractional remainder, find the *Area Seg.* answering to the first three decimals of the quotient; subtract it from the next greater *Area Seg.*; multiply the remainder by the fractional part of the quotient, and the product will be the corresponding proportional part to be added to the first *Area Seg.*

**EXAMPLE.** If the versed sine be 25, and the diameter 55, we have  $\frac{25}{55} = .454\frac{5}{11}$ , the tabular height. The *Area Seg.* answering to .454, is .346764; the next greater *Area Seg.* is .347759; their difference is .000995; then  $.000995 \times \frac{5}{11} = .000452$ , which being added to .346764, gives .347216, the *Area Seg.* corresponding to  $.454\frac{5}{11}$ .

*Note 2.* When the area of a segment greater than a semi-circle is required, subtract the quotient of the height by the diameter, from 1; find the *Area Seg.* corresponding to the remainder, which take from .785398, and the difference will be the *Area Seg.* answering to the quotient.

**EXAMPLE.** If the versed sine be 66, and the diameter 80, we have  $\frac{66}{80} = .825$ , the tabular height; then  $1 - .825 = .175$ ; and the *Area Seg.* answering to .175, is .092313, which being taken from .785398, leaves .693085, the *Area Seg.* corresponding to .825.

#### EXAMPLES.

1. The chord A B measures 120, and the versed sine C E 30 inches; what is the area of the segment A C B, in ale and wine gallons, and malt bushels?

By *Note 2*, under *Rule 1*, we have  $\frac{60^2}{30} + 30 = \frac{3600}{30} + 30 = 120 + 30 = 150$ , the diameter C D; then  $\frac{30.0}{150} = .2$ , the tabular height, or quotient of the versed sine divided by the diameter. The *Area Seg.* corresponding to this quotient, is .111823; then  $.111823 \times 150^2 = .111823 \times 22500 = 2516.0175$ , the area in square inches; and  $2516.0175 \div 282 = 8.922$ , the area in ale gallons;  $2516.0175 \div 231 = 10.8918$ , the area in wine gallons; and  $2516.0175 \div 2150.42 = 1.17$ , the area in malt bushels.

2. The versed sine  $CE$  is 32, and the diameter  $CD$  100 inches; what is the area of the segment  $ACB$ , in ale and wine gallons?

*Ans.* 10.151 ale gallons, and 12.392 wine gallons.

3. What is the area of the segment  $ADB$ , greater than a semi-circle, in ale and wine gallons, and malt bushels; the versed sine  $ED$  being 40, and the diameter  $CD$  62.5 inches?

*Ans.* 7.353 ale gallons, 8.976 wine gallons, and .96 malt bushels.

### PROBLEM XVI.

*To find the area of an ellipse.*

#### RULE.

*By the Pen.*

Divide the product of the two diameters by 359.05, 294.12, and 2738; and the respective quotients will be the area of the ellipse, in ale and wine gallons, and malt bushels.

*Note 1.* If the two diameters of an ellipse and the number .7854 be multiplied continually together, the last product will be the area of the ellipse in square inches.

2. If the sum of the two diameters of an ellipse be multiplied by 1.5708, the product will be the circumference of the ellipse, *nearly*.

#### EXAMPLES.

1. Required the area of the ellipse  $ABCD$ , in ale and wine gallons, and malt bushels; the transverse diameter  $AB$  measuring 102.5, and the conjugate  $CD$  75.2 inches.

$$\begin{array}{r}
 \text{Inches.} \\
 102.5 \\
 75.2 \\
 \hline
 2050 \\
 5125 \\
 7175 \\
 \hline
 \text{Divisor } 359.05 \overline{) 7708.00} (21.467 \text{ ale gallons.} \\
 \underline{71810} \\
 52700 \\
 \underline{35905} \\
 167950 \\
 \underline{143620} \\
 243300 \\
 \underline{215430} \\
 278700 \\
 \underline{251835} \\
 27365
 \end{array}$$

Also,  $7708.00 \div 294.12 = 26.206$  wine gallons; and  
 $7708.00 \div 2738 = 2.815$  malt bushels.

*By the Sliding Rule.*

As the circular divisor on A, is to the transverse diameter on B; so is the conjugate diameter on A, to the area on B.

$$\begin{array}{cccc}
 \text{On A.} & \text{On B.} & \text{On A.} & \text{On B.} \\
 \text{As } \left\{ \begin{array}{l} 359.05 \\ 294.12 \\ 2738.00 \end{array} \right\} : 102.5 :: 75.2 : \left\{ \begin{array}{l} 21.47 \text{ ale gallons.} \\ 26.21 \text{ wine gallons.} \\ 2.82 \text{ malt bushels.} \end{array} \right.
 \end{array}$$

2. Suppose the foregoing figure to represent the base of an elliptical cooler; what is the content in ale gallons, when the depth of the liquor is 10.8 inches?

*Ans.* 231.8436 ale gallons.

3. The transverse diameter of an elliptical wine-vat measures 85.9, and the conjugate 63.8 inches; what is its area in wine gallons?

*Ans.* 18.633 wine gallons.

4. A maltster has an elliptical cistern whose transverse diameter measures 96.8, and conjugate 73.2 inches; required the area and content in malt bushels, when depth of the grain is 34.7 inches.

*Ans. The area is 2.587, and the content 89.7689 malt bushels.*

5. The transverse diameter of an elliptical guile-measure measures 96.4, and the conjugate 82.3 inches; required the area and content, in ale gallons, when the depth of the liquor is 53.8 inches.

*Ans. The area is 22.096, and the content 1188.7648 ale gallons.*

### PROBLEM XVII.

*To find the area of an elliptical segment, the base of which is parallel to either of the diameters of the ellipse.*

#### RULE.

#### *By the Pen.*

Divide the height of the segment by that diameter of the ellipse of which it is a part, and find the *Area Seg.* answering to the quotient, in the Table at the end of Part IV. Multiply the two diameters of the ellipse and the *Area Seg.* thus found, continually together, and the last product will be the area in square inches.

Divide this area by 282, 231, and 2150.42, and the respective quotients will be the area in ale and wine gallons, and malt bushels.

*Note.* If the segment be greater than a semi-ellipse, find the area of the remaining segment, which subtract from the area of the whole ellipse; and the remainder will be the area of the segment required. Or, proceed as directed in Problem XV., Rule II., Note II.

#### EXAMPLES.

1. Required the area, in ale gallons, of the elliptical segment A C B, cut off by the double ordinate A B; the height G C being 36.4, the diameter C D of the whole ellipse 120.8, and the diameter E F 75.4 inches.

Here  $\frac{36.4}{120.8} = .301$ , the tabular height; and the corresponding Area Seg. is .199085; then  $.199085 \times 120.8 \times 75.4 = 1813.3298$ , the area of the segment in square inches; and  $\frac{1813.3298}{282} = 6.4302$ , the area in ale gallons.

2. What is the area of the segment A D B, in wine gallons; the dimensions being the same as in the last example?

*Ans.* 23.1181 wine gallons.

3. Required the area in malt bushels, of the greater segment of an ellipse made by a double ordinate parallel to the conjugate diameter, at the distance of 27 inches from the centre of the ellipse; the diameters being 180 and 120 inches.

*Ans.* 5.4282 malt bushels.

### PROBLEM XVIII.

To find the area of a parabola, its base and height being given.

#### RULE.

*By the Pen.*

Multiply the base by the height, and  $\frac{2}{3}$  of the product will be the area in square inches, which being divided by 282, 231, and 2150.42, will give the area in ale and wine gallons, and malt bushels.

*Note.* A parabola is a figure or section formed by cutting a cone by a plane parallel to one of its slant sides; and several parabolas may be

cut from the same cone, which will all vary in their bases and altitudes according to the distance of the cutting plane from the parallel side of the cone. (See the definitions in Part V.)

### EXAMPLES.

1. What is the area, in ale gallons, of the parabola  $A B C$ , whose height  $D B$  is 54.5, and the base or double ordinate  $A C$  72.8 inches?

Here  $72.8 \times 54.5 \times \frac{2}{3} = \frac{72.8 \times 54.5 \times 2}{3} = \frac{3967.6 \times 2}{3} = \frac{7935.2}{3} = 2645.0666$ , the area in square inches; and  $2645.0666 \div 282 = 9.3796$ , the area in ale gallons.

### By the Sliding Rule.

As the square divisor on A, is to the perpendicular on B; so is  $\frac{2}{3}$  of the base on A, to the area on B.

On A.      On B.      On A.      On B.  
As 282 : 54.5 :: 48.5 : 9.38 ale gallons.

2. The absciss or height  $B D$  is 36.2, and the double ordinate  $A C$  108.6; what is the area of the parabola  $A B C$ , in wine gallons? *Ans.* 11.3458 wine gallons.

## PROBLEM XIX.

*To find the area of compound figures.*

## RULE.

*By the Pen.*

By the foregoing Problems, find the areas of the several figures of which the whole compound figure is composed; and the sum of these areas will be the area required.

*Note 1.* Mixed or compound figures are such as are composed of rectilinear and curvilinear figures united.

2. If the curvilinear part of the figure be irregular, its area must be found by the method described in the next Problem; and as it is sometimes difficult to determine the nature of curves, it would be advisable always to adopt it in Practice, when the true nature of the curve cannot be discovered.

## EXAMPLES.

1. What is the area, in ale and wine gallons, of the compound figure A B C D E F, composed of a trapezium and two circular segments; the chord A E measuring 75.6, and the versed sine F a 9.6; the diagonal E B 136, the perpendicular A m 64, and D n 64.8; the chord B D 92, and the versed sine C a 14 inches?

By Prob. VI., we have  $\frac{64 + 64.8 \times 136}{2} = \frac{128.8 \times 136}{2}$   
 $= \frac{17516.8}{2} = 8758.4$ , the area of the trapezium  $A B D E$ ,  
 in square inches.

By Prob. XV., we have  $75.6 \times 9.6 \times \frac{2}{3} = 725.76 \times \frac{2}{3} =$   
 $\frac{1451.52}{3} = 483.84$ , two-thirds of the product of the chord and  
 versed sine; and  $\frac{9.6^3}{75.6 \times 2} = \frac{884.736}{151.2} = 5.851$ , the cube of  
 the height divided by twice the chord; then  $483.84 + 5.851$   
 $= 489.691$ , the area of the segment  $A F E$ , in square in-  
 ches.

Again, by the same Prob. we have  $92 \times 14 \times \frac{2}{3} = 1288 \times \frac{2}{3} =$   
 $\frac{2576}{3} = 858.666$ , two-thirds of the product of the chord and  
 versed sine; and  $\frac{14^3}{92 \times 2} = \frac{2744}{184} = 14.913$ , the cube of the  
 height divided by twice the chord; then  $858.666 + 14.913 =$   
 $873.579$ , the area of the segment  $B C D$ , in square inches.

Now,  $8758.4 + 489.691 + 873.579 = 10121.67$ , the area  
 of the whole compound figure in square inches; hence,  
 $10121.67 \div 282 = 35.892$ , the area in ale gallons; and  
 $10121.67 \div 231 = 43.816$ , the area in wine gallons.

2. Required the area and content in ale gallons, of a  
 cooler composed of a triangle, and a circular segment,  
 whose chord is the longest side of the triangle; the  
 versed sine of the segment being 26, the sides of the  
 triangle 75, 100, and 125 inches respectively, and the  
 depth of the liquor 8.6 inches?

Ans. The area is 21.23, and the content 182.578 ale  
 gallons.

# PROBLEM XX.

To find the area of any curvilinear figure by means of equi-distant ordinates.

## RULE.

*By the Pen.*

If a right line A N be divided to any even number of equal parts C, C E, E G, &c.; and at the points of division be erected perpendicular ordinates A B, C D, E F, &c., terminated by any curve B D F, &c., and if A be put for the sum of the extreme or first and last ordi-

tes A B, N O; B for the sum of the even ordinates D, G H, L M, &c.; viz. the second, fourth, sixth, &c., and C for the sum of all the rest E F, I K, &c.; viz. the third, fifth, &c., or the odd ordinates, wanting the first and last: then the common distance A C, or C E, &c. of the ordinates, being multiplied by the sum arising from the addition of A, four times B, and two times C: one-third of the product will be the area A B O N, in square

ches, very nearly; that is,  $\frac{A + 4B + 2C}{3} \times D = \text{the area,}$

putting  $D = A C$ , the common distance of the ordinates.

*Note.* The foregoing Rule being expressed in Algebraic terms, is almost perfectly comprehended by learners; but when it is simplified in the following manner, it may be easily understood and committed to memory.

## RULE.

To the sum of the extreme, or first and last ordinates, add four times the sum of all the even ordinates, and twice the sum of all the odd ordinates, not including the first and last; multiply this sum by  $\frac{1}{3}$  of the common distance of the ordinates, and the product will be the area in square ches. Divide this area by 282, 231, and 2150.42, and

the respective quotients will be the area in ale and wine gallons, and malt bushels.

*Note 1.* If the common distance of the ordinates will not divide 3, multiply by that distance, divide the product by 3, and the quotient will be the area in square inches.

2. The length of the base line must be ascertained before you begin to measure the ordinates, in order that you may divide it into an even number of equal parts; and it is evident that you will determine the area most correctly when you use the greatest number of ordinates.

3. If the figure whose area is required be elliptical, the ordinates must be taken perpendicularly to the transverse diameter; and the areas of the two segments cut off by the extreme ordinates may be found by Problem XVII. If, however, the segments be small, it will be more easy, and correct enough for *general practice*, to consider them as parabolas; consequently their areas must be found by Problem XVIII.

Or, if the heights of the segments be equal to each other, multiply the sum of the extreme ordinates by the sum of the heights of the segments, and  $\frac{1}{3}$  of the product will be the area of both segments *nearly*. To the area thus found, add the area of that part of the figure measured by equi-distant ordinates; and the sum will be the whole area in square inches, which must be divided by the proper divisors as before directed.

4. If the area of any figure resembling a parabola, the segment of a circle, or the segment of an ellipse be required, and it cannot be determined to which of these denominations it belongs, divide the base or chord-line into an even number of equal parts; and measure ordinates from the base to the curve. In this case, the first and last ordinates will be nothing; but notwithstanding this, the Rule for equi-distant ordinates will give the area of the figure extremely near the truth; and if there be an ordinate at one end of the base, and none at the other, the Rule may still be applied with success. (See Ex. 3.)

### SCHOLIUM.

The method of finding the areas of curvilinear figures, by means of equi-distant ordinates, was first demonstrated by the illustrious Sir Isaac Newton.

Mr. Robert Shirtcliffe, in his *Theory and Practice of Gauging*, appears to have been the first who applied it to finding the areas of curvilinear vessels used by brewers, distillers, &c.; and after him Mr. Samuel Farrer, in the *Appendix to Overley's Gauging*. Their Rules, however, were extremely tedious; and, though true to demonstra-

tion, were not general, but particular, according to the number of ordinates used.

To obviate this inconvenience, the *general rule*, given in this Problem, was deduced from Simpson's Dissertations, page 109, by Mr. Thomas Moss; and demonstrated in his valuable Treatise of Gauging, page 235.

Dr. Hutton, in his Mensuration, Proposition I., Section II., Part IV., has also given an elegant demonstration of the same Rule; and adds, in a Corollary, that it will obtain for the contents of all solids, by using the areas of the sections perpendicular to the axe, instead of the ordinates.

The Doctor particularly recommends it to the notice of *Practical Gaugers*, as being the best approximation that has yet been, or perhaps ever can be given; for by taking an indefinite number of ordinates, or sections, the areas, or contents of irregular figures may be obtained to any degree of accuracy.

Now as the bases of Distillers' wash-backs, Brewers' coolers, &c. &c. are sometimes greater and sometimes less than true ellipses, it becomes absolutely necessary to find the areas of all such vessels by the method of Equidistant Ordinates, otherwise the Trader or the Revenue may be materially injured. Of this it appears that the Honourable Commissioners of the Board of Excise were fully convinced; as they, in a General Letter, dated July 1775, issued an order to that effect.

This order was again repeated, on the 3rd of February, 1818, in another General Letter, which also contains some observations relating to the qualifications and mathematical knowledge of Officers of the Excise.

### EXAMPLES.

#### EXAM. 1.

What is the area of the curved figure A B C D, in ale and wine gallons, and malt bushels; the lengths of five equidistant ordinates being as follow; viz. the first or A D = 40, the second = 50, the third = 60, the fourth = 70, and the fifth or last B C = 75; and the length of the base A B = 120 inches?

Here  $40 + 75 = 115$ , the sum of the first and last ordinates;  $50 + 70 \times 4 = 120 \times 4 = 480$ , four times the sum of the even ordinates;  $60 \times 2 = 120$ , twice the sum of the odd ordinates; and  $120 \div 4 = 30$ , the common distance of the ordinates; then  $115 + 480 + 120 \times 10$  (one-third of the common distance)  $= 715 \times 10 = 7150$ , the area in square inches; hence  $7150 \div 282 = 25.354$ , the area in ale gallons;  $7150 \div 231 = 30.952$ , the area in wine gallons; and  $7150 \div 2150.42 = 3.324$ , the area in malt bushels.

## EXAM. 2.

If the foregoing figure represent the base of a cooler, what is its content in ale gallons, when the depth of the liquor is 12.6 inches?

Here  $25.354 \times 12.6 = 319.4604$  ale gallons, the answer required.

## EXAM. 3.

Required the area of the curvilinear figure A B C D A, in ale and wine gallons; the base A C being 95.2, the ordinate  $m m$  15.9, B D 22.3, and  $n n$  17.4 inches.

(See Note 4.)

Here the sum of the extreme ordinates  $= 0$ ; and  $15.9 + 17.4 \times 4 = 33.3 \times 4 = 133.2$ , four times the sum of the even ordinates; also  $22.3 \times 2 = 44.6$ , twice the sum of the odd ordinates;

nates; and  $95.2 \div 4 = 23.8$ , the common distance of the ordinates, which will not divide by 3, (See Note 1.;) then

$$\frac{138.2 + 44.6 \times 23.8}{3} = \frac{177.8 \times 23.8}{3} = \frac{4231.64}{3} = 1410.546,$$

the area in square inches; and  $1410.546 \div 282 = 5.001$ , the area in ale gallons; and  $1410.546 \div 231 = 6.106$ , the area in wine gallons.

*Note.* It is evident that the figures  $Amm$ , and  $Cnn$ , are greater than triangles; and that the figures  $BmmD$ , and  $BnnD$ , are greater than trapezoids; but if we consider them as triangles and trapezoids, and find their areas by Problems IV. and VII., we hence obtain the area of the whole figure  $ABCD A = 1323.28$  square inches, which is 87.266 square inches less than the area found by equi-distant ordinates.

Again, it is evident, from the dimensions, that the figure  $ABCD A$  cannot be a parabola; but by inspection, it appears that the nature of the curve approaches very nearly to that figure. Now, if we consider it as a parabola, and find its area by Problem XVIII., we obtain 1415.906 square inches, which area is only 4.86 square inches more than that obtained by equi-distant ordinates.

These observations tend to prove that the Rule for equi-distant ordinates will always give *nearly* the true area, whatever be the shape of the figure.

#### EXAM. 4.

Let the following figure represent the base of an elliptical vessel; it is required to take the dimensions, and find the area in ale and wine gallons, and malt bushels.

## TO TAKE THE DIMENSIONS,

By Prob. XXIX., Part III., find the centre of the vessel, and also the transverse and conjugate diameters  $A C$ , and  $B D$ , which must be struck with a chalk-line.

At a convenient distance from  $A C$ , by Prob. III., make the two parallel lines  $m n$ ,  $m n$ .

Take the common distance in the compasses, and set it from 6 to 7, from 7 to 8, &c.; also, from 6 to 5, from 5 to 4, &c.; and likewise both ways from  $a$  to  $c$ , from  $c$  to  $e$ , &c.

Through the three points  $x 1 x$ ,  $s 2 s$ ,  $r 3 r$ , &c. with a chalk-line, strike the ordinates, or rather double ordinates,  $E 1 E$ ,  $F 2 F$ ,  $G 3 G$ , &c. &c. until you have finished the whole; the lengths of which may then be taken, in inches and tenths, with the dimension-cane, and other proper instruments.

Or, the common distance may be set off in the following manner, without the compasses: let your assistant hold the end of the tape at 6, (the centre of the vessel,) and suppose the common distance of the double ordinates to be 12 inches; then with a thin piece of chalk, make marks upon the bottom of the cooler, both ways, from the centre, at the distance of 12, at 24, at 36 inches, &c. from the end of the tape; and you will thus determine the points, 7, 8, 9, &c. and also the points 5, 4, 3, &c. Do the same upon the two parallel lines  $m n$ ; and then strike the double ordinates as before directed.

*Note 1.* As the operation of finding the centre of an elliptical vessel, and drawing the diameters by Prob. XXIX., Part III., is rather tedious, it is seldom followed in Practical Gauging. The general method is to let an assistant hold one end of the tape at  $A$ , and by repeated trials to find the longest diameter  $A C$ , which must then be struck with a chalk-line. By the same method the conjugate diameter  $B D$ , is determined, which will always be the longest that can be found within the vessel, perpendicular to  $A C$ .

2. In the practice of Gauging, the method described in the last Note, has a decided advantage over that given in Prob. XXIX., Part III.; for it is frequently found in taking the dimensions of an oval utensil, that the conjugate diameter does not intersect the transverse in the centre of the vessel. This will always be the case when the vessel is made in an irregular manner.

3. When the transverse and conjugate diameters of the base of an oval vessel are drawn, the vessel is said, by Gaugers, to be quartered.

 \end{array}$$

*Note.* The figure belonging to the last example is a true ellipse; the lengths of the ordinates having been found by Prob. I., Part VII., of Nesbit's Mensuration.

Its true area obtained by Prob. XVI., Part IV., of this Work, is 30.480 ale gallons. This exceeds the area found by equi-distant ordinates no more than .036 of a gallon, which proves the approximation, by equi-distant ordinates, to be *very near* the truth; and if the ordinates had been taken at the distance of six inches from each other, instead of twelve, the difference would have been still less.

**EXAM. 5.**

Required the area in ale gallons, of the curvilineal figure A B C D, from the following dimensions: namely, the transverse diameter A C measures 156 inches; the conjugate diameter B D, which falls 4 inches from the middle of the transverse, 112 inches; the height A n, of

the segment E A E, 4 inches; the height C r, of the segment S C S, 8 inches; the common distance of the ordinates 12 inches; and the ordinates themselves as below:

*Ordinates.*

		<i>Inches.</i>
1.	E E	= 34.8
2.	F F	= 66.8
3.	G G	= 84.0
4.	H H	= 95.2
5.	I I	= 104.8
6.	K K	= 110.0
7.	B D	= 112.0
8.	L L	= 110.4
9.	M M	= 106.2
10.	N N	= 97.6
11.	P P	= 84.6
12.	R R	= 69.8
13.	S S	= 48.8

*To construct the figure from the foregoing dimensions.*

By any convenient scale of equal parts, draw the conjugate diameter B D = 112, and bisect it perpendicularly with the transverse diameter A C, drawn at pleasure.

Take the common distance 12, in your compasses, and set it off upon the diameter A C, from *x* to *a*, from *a* to *v*, six times, both ways, to *r* and *n*; and you will have places of all the ordinates.

Set off 4 from *n* to A, and 8 from *r* to C; and you have the transverse diameter A C, which will measure 156 inches, if the various operations have been accurately performed.

Draw lines parallel to the conjugate diameter B D, and through points *a*, *c*, *e*, &c. with a parallel-ruler, draw all the ordinates at pleasure.

From the point *n*, set off both ways to E, 17.4, half of the first ordinate; also, from *n*, set off both ways to 3.4, half of the second ordinate; and thus proceed until you have determined the extreme points of all the ordinates, through which, with a steady hand, describe the circumference of the figure.

### *To find the Area.*

Take  $34.8 + 48.8 = 83.6$ , the sum of the extreme ordinates;  $(66.8 + 95.2 + 110. + 110.4 + 97.6 + 69.8) \times 4 = 2199.2$ , four times the sum of all the even ordinates; and  $(84.0 + 104.8 + 112.0 + 106.2 + 84.6) \times 2 = 983.2$ , twice the sum of all the odd ordinates; then  $(2199.2 + 983.2) \times 4 = 3266 \times 4 = 13064$ , the area of the figure E B S S D E.

Prob. XVIII., we have  $34.8 \times 4 = 139.2$ , the product of the base and height of the segment E A E; and  $48.8 \times 8.4$ , the product of the base and height of the segment E C E; then  $139.2 + 390.4 \times \frac{2}{3} = 529.6 \times \frac{2}{3} = \frac{529.6 \times 2}{3} =$

$353.066$ , the area of both the segments.

Now,  $13064.0 + 353.066 = 13417.066$  square inches, the area of the curvilinear figure A B C D; and  $13417.066 \div 47.578$  ale gallons, the area required.

### REMARK.

The area of the foregoing figure, found by the Rule for the ellipse, Prob. XVI., is 48.661 ale gallons. This

is 1.088 gallons more than the area found by equi-distant ordinates, which shows the figure to be less than a true ellipse.

Now, if we suppose the figure to represent the base of a guile-tun whose sides are perpendicular, and the depth of the liquor 36 inches, and the area found as an ellipse we have  $1.088 \times 36 = 38.988$  ale gallons, the quantity of liquor for which the trader will be unduly charged due to the consequence of not finding the area of the vessel by equi-distant ordinates.

#### EXAM. 6.

Required the area of a curvilinear vessel, in ale and wine gallons; the transverse diameter being 174.6 inches, the conjugate diameter 106.4 inches, the versed sine of each segment 3.3 inches, the common distance of 15 perpendicular ordinates 12 inches, and the ordinates themselves as below:

#### Ordinates.

		Inches.
1.	=	35.2
2.	=	72.4
3.	=	88.6
4.	=	99.0
5.	=	102.8
6.	=	104.2
7.	=	105.2
8.	=	106.4
9.	=	105.3
10.	=	104.5
11.	=	102.7
12.	=	99.2
13.	=	88.7
14.	=	72.5
15.	=	35.3

Ans. The area is 55.725 ale gallons, and 68.029 wine gallons.

#### REMARK.

The area found by the Rule for the ellipse, Prob. XVI. is 51.740 ale gallons, and 63.162 wine gallons, which is less than the true area by 3.985 ale gallons, and 4.867 wine gallons.

Now, if we suppose the figure to represent the base of a cooler, and let the depth of the liquor be 8 inches, we have  $3.985 \times 8 = 31.88$  ale gallons, the quantity of liquor for which no duty will be charged, if the area of the figure be found by the Rule for the ellipse, and the duty estimated from the gauge thus obtained. And this will happen once only, but every brewing, if the cooler be gauged by this method, in the Officer's Dimension Book.

Again, if we suppose the figure to represent the base of a stiller's Wash Back, whose sides are perpendicular, and the depth of the liquor 36 inches, we have  $4.867 \times 36 = 175.212$  wine gallons, the quantity of liquor for which no duty will be charged, if the area of the vessel be found by the Rule for the ellipse; hence it appears that the revenue, or the trader, may be greatly injured, if they do not gauge and fix all oval vessels which are not true ellipses, by the method of equi-distant ordinates. See the last remark; and also Problem XXX., Part III., where a method is given to determine whether an oval is greater or less than a true ellipse.)

EXAM. 7.

Required the area of a curvilinear vessel, in ale and wine gallons, and malt bushels; the transverse diameter 72 inches, the conjugate diameter 71 inches, the sine of each segment 5 inches, the common distance of 9 perpendicular ordinates 14 inches, and the ordinates themselves as below:

*Ordinates.*

*Inches.*

1.	=	31.2
2.	=	50.8
3.	=	62.0
4.	=	68.2
5.	=	71.0
6.	=	68.8
7.	=	62.0
8.	=	52.0
9.	=	32.0

The area is 24.153 ale gallons, 29.485 wine gallons, and 3.167 malt bushels.

The area found by the Rule for the ellipse, Prob. XVI., is

24.121 ale gallons. This differs from the area found by equidistant ordinates, only .032 of a gallon, which shows the figure to be nearly true ellipse.

 II.; and the method of constructing it may be seen in Moss's  
 ing, page 92.

## PART V.

## MENSURATION OF SOLIDS

APPLIED TO

## GAUGING.

## DEFINITIONS OF SOLIDS.

1. A **SOLID** is a figure which generally consists of three dimensions ; viz. length, breadth, and thickness,

2. The *measurement* of a solid is called its solidity, capacity, or content.

3. The *contents* of solids are estimated by a cube whose side is one inch, one foot, one yard, &c. called the *measuring-unit* ; hence the solidity of a body is said to be so many cubic inches, feet, yards, &c. as are contained in that body. In Gauging, however, the contents of all vessels are reduced to *ale gallons, wine gallons, malt bushels, &c. &c.*

4. A *cube* is a solid having six equal square sides,

5. A *parallelepipedon* is a solid having six rectangular sides, every opposite two of which are equal and parallel.

6. A *prism* is a solid whose ends are two equal, parallel, and similar plane figures; and its sides rectangles.

It is called a *triangular prism* when its ends are triangles; a *square prism*, when its ends are squares; a *pentagonal prism*, when its ends are pentagons, &c.

7. A *cylinder* is a solid conceived to be described by the revolution of a right-angled parallelogram about one of its sides, which remains fixed, and is called the *axis* of the cylinder; or it is a solid whose ends are parallel circles, and its sides right-lines.

*Note.* When the parallel ends of a solid are bounded by dissimilar curves; that is, when one end is bounded by an ellipse and the other by a circle, the figure is called a *cylindroid*.

8. A *pyramid* is a solid the base of which is any plane figure whatever, and its sides are triangles, meeting in a point, called the *vertex* of the pyramid.

9. A *cone* is a solid conceived to be described by the revolution of a right-angled triangle about one of its legs,

which remains fixed, and is called the *axis* of the cone, or it is a pyramid of an infinite number of sides, having a circle for its base.

*Note.* When the base of a cone is an ellipse, the solid is called an elliptical cone.

10. The *frustum* of a pyramid or cone is that part which remains when the top is cut off by a plane parallel to the base. The part cut off is called a *segment*.

11. A *wedge* is a solid whose base is a rectangle, its two ends plane triangles, and its two opposite sides terminate in an edge.

12. A *prismoid* is a solid whose bases or ends are two right-angled parallelograms, being parallel but not similar to each other; and its sides four plane trapezoids.

13. A *sphere* or *globe* is a solid conceived to be formed

The rotation of a semi-circle about its diameter, which remains fixed, and is called the *axis* or diameter; or it is bounded by one continued convex surface, every point of which is equally distant from a point within, called the centre.

The *segment* of a sphere is any part of it cut off by a plane. If the plane pass through the centre, it divides the sphere into two equal parts called *hemispheres*.

The *zone* of a sphere is a part intercepted between two parallel planes, and if these planes be equally distant from the centre, it is called the *middle zone* of the sphere.

A circular spindle is a solid conceived to be formed by the revolution of a circular segment about its chord, which remains fixed.

*Cylindrical hoops* or *ungulas* are solids formed by the section of a cylinder in different directions, and may be divided into six varieties; viz. 1st, when the cutting plane is parallel to the axis of the cylinder, and passes through both ends; 2nd, when the plane is oblique to the axis and passes through both ends; 3rd, when the plane is perpendicular to the axis and passes through both ends; 4th, when the plane is oblique to the axis, passes through the side, and makes the segment of the base less than a semi-circle; 5th, when the plane enters the side, passes through the base, and makes the segment of the base a semi-circle; and 6th, when the plane enters the side, passes through the

base, and makes the segment of the base greater than a semi-circle.

18. In the two first cases, the sections will be *rectangles*; in the third case, the section will be an *ellipse*; in the fourth case, it will be the less *segment* of an *ellipse*; in the fifth case, it will be a *semi-ellipse*; and in the sixth case, it will be the greater *segment* of an *ellipse*.

19. A cylinder may also be cut by a plane passing obliquely through the opposite extremities of the two ends. In this case the cylinder will be divided into two *ungulas*, each of which will be half a cylinder; and the section will be an *ellipse*.

20. *Conic hoofs* or *ungulas* are solids formed by cutting the frustum of a cone in different directions; and may be divided into eight varieties; viz. 1st, when the cutting plane is parallel to the axis of the frustum, and passes through both ends; 2nd, when the plane is oblique to the axis, and passes through both ends; 3rd, when the plane passes obliquely through the opposite extremities of the two ends; 4th, when the plane passes obliquely through the sides; 5th, when the plane enters the side, and passes through the less end; 6th, when the plane enters the side, passes through the greater base or end, and makes a less angle with the base than that made by the base and the side of the frustum; 7th, when the plane cuts the side, passes through the greater base, and is parallel to one of the sides; and 8th, when the plane enters the side, passes through the greater base, and is parallel to the axis of the frustum.

21. In the two first cases, the sections will be *trapezoids*; in the third and fourth cases, the sections will be *ellipses*; in the fifth and sixth cases, the sections will be *elliptical segments*; in the seventh case, the section will be a *parabola*; and in the eighth case, the section will be a *hyperbola*. (See the definitions of the Conic Sections.)

22. *Pyramidical* and *prismoidal ungulas* are solids formed by cutting the frustum of a square pyramid, or a prismoid in different directions; and are generally either *wedges* or *prismoids*.

*Note.* All the *ungulas* mentioned in the preceding definitions, may be formed by *liquor* in cylindrical, conical, pyramidical, and prismoidal vessels, placed in different positions.

## DEFINITIONS

OF THE

*Conic Sections and their Solids.*

---

1. CONIC SECTIONS are plane figures formed by cutting a cone.

According to the different positions of the cutting plane, there will arise five different figures or sections.

2. If the cutting plane pass through the vertex of the cone, and any part of the base, the section will be a triangle.

3. If a cone be cut into two parts, by a plane parallel to the base, the section will be a circle.

4. If a cone be cut by a plane passing through its two slant sides in an oblique direction, the section will be an

P 2

ellipse or ellipsis; A and B being the vertices, and A B the transverse diameter.

*Note.* The method of constructing an ellipse is given in Problem XV., Part III.

5. If a cone be cut by a plane parallel to either of its slant sides, the section will be a *parabola*; thus, if the cone A B C be cut by a plane parallel to the slant side A C, the section D E F will be a *parabola*; F being its vertex, G F its axis, and D E its base. The solid D E B F D, cut off by the plane, is called a *parabolical hoof* or *ungula*.

*Note.* The method of describing a parabola may be seen in Nesbit's Mensuration, page 319.

6. If a cone be cut by a plane parallel to its axis, or in such a manner that the plane, if continued, would meet the opposite cone, the section will be a *hyperbola*; thus, if the cone A B C be cut by a plane parallel to its axis C L, or in such a manner that the plane, if continued, would meet the opposite side of a similar cone, as at H, the section D E F will be a *hyperbola*; D E being its base, F and H its vertices, G its centre, F H its transverse

diameter, and  $CG$  its semi-conjugate. The solid  $DEBFD$ , cut off by the plane, is called a hyperbolic hoof or ungula.

*Note 1.* The method of constructing a hyperbola, may be seen in Nesbit's Mensuration, page 323.

2. All the figures that can possibly be formed by cutting a cone, are mentioned in the preceding definitions; and are five in number; viz. a *triangle*, a *circle*, an *ellipse*, a *parabola*, and a *hyperbola*; but the three last only, are usually denominated CONIC SECTIONS.

7. The *vertex* of a conic section is that point where the cutting plane meets the opposite sides of the cone, as at  $A$  and  $B$ , in the ellipse; at  $F$ , in the parabola; and at  $F$  and  $H$ , in the hyperbola; hence the ellipse and hyperbola have each two vertices, but the parabola has only one vertex.

8. The *axis* of a parabola or a hyperbola, is a right-line drawn from the vertex to the middle of the base.

9. An *ordinate* is a right line drawn perpendicularly from any point in the axis, and terminating in the curve; consequently, the double ordinate is a right-line passing perpendicularly through the axis, and terminating at both ends, in the curve.

10. An *absciss* is that part of the axis which is contained between the vertex and the ordinate.

11. The *parameter* of any diameter is a third proportional to that diameter and its conjugate.

The parameter is sometimes called the *latus rectum*.

12. The *focus* is a point in the axis where the ordinate is equal to half the parameter.

13. The ellipse and hyperbola have each two *foci*: but the parabola has only one *focus*.

14. A *spheroid* or *ellipsoid* is a solid generated by the revolution of an ellipse about one of its diameters. If the revolution be made about the transverse diameter, the solid is called a *prolate spheroid*; but if about the conjugate diameter, an *oblate spheroid*.

15. A *conoid* is a solid formed by the revolution of a parabola, or hyperbola, about its axis; and is accordingly called *parabolic*, or *hyperbolic*.

The parabolic conoid is also called a *paraboloid*; and the hyperbolic conoid, a *hyperboloid*.

16. An *elliptic*, a *parabolic*, or a *hyperbolic spindle*, is a solid formed by the revolution of a segment of an ellipse, a parabola, or a hyperbola, about its double ordinate, which remains fixed. (See the circular spindle.)

## GENERAL PROPERTIES

OF THE

### *Conic Sections.*

---

#### PROPERTIES OF THE ELLIPSE.

1. The square of the distance of the focus from the centre, is equal to the difference of the squares of the semi-axes.

2. The sum of two lines drawn from the foci, to meet at any point in the curve, is equal to the transverse axis.

3. The parameter, or double ordinate at the focus, is equal to the square of the conjugate diameter divided by the transverse.

4. The rectangles of the segments of any diameter, are as the squares of their ordinates.

5. All the parallelograms circumscribed about an ellipse are equal to one another, and each equal to the rectangle of the two axes.

6. An ellipse is to the rectangle of the two axes, as any circle is to the square of its diameter.

7. The areas of ellipses are to one another, as the rectangles of their transverse and conjugate axes.

8. As the transverse axis of an ellipse is to the conjugate, so is the area of a circle whose diameter is the transverse, to the area of the ellipse.

#### PROPERTIES OF THE PARABOLA.

1. The distance of the focus from the vertex is equal to the square of any ordinate divided by 4 times its absciss.

2. The parameter, or double ordinate at the focus, is equal to the square of any ordinate divided by its absciss.

3. The distance between the focus and the vertex is equal to  $\frac{1}{4}$  of the parameter, or  $\frac{1}{2}$  of the ordinate at the focus.

4. As the parameter is to the sum of any two ordinates, so is the difference of those ordinates to the difference of their abscissas.

5. Abscissas are to each other as the squares of their ordinates.

6. All parabolas are similar to each other.

7. The area of a parabola is equal to  $\frac{2}{3}$  of the area of the circumscribing parallelogram.

#### PROPERTIES OF THE HYPERBOLA.

1. The square root of the sum of the squares of the semi-axes, is equal to the distance of the focus from the middle of the transverse axis.

2. If half the transverse axis be subtracted from the distance between the focus and the middle of the said axis, the remainder will be the distance of the focus from the vertex.

3. The difference of two lines drawn from the two foci to any point in the curve, is equal to the transverse axis.

4. The parameter, latus rectum, or double ordinate at the focus, is equal to the square of the conjugate divided by the transverse.

*Note.* Those who desire to obtain a complete knowledge of the properties of Conic Sections, are referred to the Works of Emerson, Hutton, and Simson on that subject.

# PROBLEMS

## IN

# PRACTICAL GAUGING.

---

### PROBLEM I.

*The side of a vessel in the form of a cube being given, to find its content in ale and wine gallons, and malt bushels.*

#### RULE.

*By the Pen.*

Multiply the side of the cube by itself, and that product again by the side; and the last product will be the content in cubic inches. Multiply the content thus found by .003546, .004329, and .000465; or divide it by 282, 231, and 2150.42; and the respective products, or quotients, will be the content in ale and wine gallons, and malt bushels.

*Note 1.* If the content of a cubical vessel be given in gallons or bushels, its side may be found by extracting the cube root of the given content, reduced to cubic inches.

2. It is scarcely necessary to observe to the young Gauger, that the internal dimensions of all vessels must be taken; hence, when we say the side of a vessel measures so many inches, we mean the internal, not the external side.

#### EXAMPLES.

1. The side A B or B C, of the cubical vessel A B C D E F G, measures 43.7 inches; what is the content in ale and wine gallons, and malt bushels?

*By Multiplication.*

*By the Sliding Rule.*

### RULE.

As the square gauge-point on D, is to the side on C so is the side on D, to the content on C.

	On D.	On C.	On D.	On C.
<i>As</i>	{ 16.79 15.19 46.36 }	: 43.7 ::	43.7 :	{ 295.93 ale gallons.
				{ 361.27 wine gallons.
				{ 38.80 malt bushels.

2. If the side of a cubical vessel measures 58.7 inches; what is its content in ale and wine gallons, and malt bushels?

*Ans.* 717.241 ale gallons, 875.598 wine gallons, and 94.056 malt bushels.

3. The side of a cubical wine-vat measures 86.5 inches; what is its content in wine gallons?

*Ans.* 2801.794 wine gallons.

4. A cubical vessel contains 862 ale gallons; required the length of its side, in inches?

*Ans.* 62.4 inches.

### REMARK.

If the content of any figure, in cubic inches, be multiplied by .000578, the square factor for a solid foot, taken from the second column of the Table of Factors, in Part IV., the product will be the content in cubic feet;

and if the content in cubic inches be divided by 1728, the square divisor, for a solid foot, taken from the fourth column of the same Table, the quotient will be the content in cubic feet.

The content of the first Example in this Problem, is 83453.453 cubic inches; then  $83453.453 \times .000578 = 48.236$ , the content in cubic feet; and  $83453.453 \div 1728 = 48.294$ , which is also the content in cubic feet.

AGAIN, if the square of the diameter of a cylinder be multiplied by the height, and the product thence arising by .000454, the circular factor, for a solid foot, taken from the third column of the same Table, the product will be the content in cubic feet; or if the product arising from the square of the diameter by the height, be divided by 2200.16, the circular divisor for a solid foot, taken from the fifth column of the same Table, the quotient will be the content in cubic feet.

The number produced by multiplying the square of the diameter by the height, in the first Example, Problem V., is 277781.2; then  $277781.2 \times .000454 = 126.112$ , the content in cubic feet; and  $277781.2 \div 2200.16 = 126.254$ , which is also the content in cubic feet.

## PROBLEM II.

*To find the content of a vessel in the form of a parallelopipedon.*

### RULE.

*By the Pen.*

Multiply the length by the breadth, and that product by the depth or altitude, and it will give the content in cubic inches. Divide the content thus obtained by 282, 31, and 2150.42; and the respective quotients will be the content in ale and wine gallons, and malt bushels.

*Note.* If the content of a parallelopipedon be divided by the product of any two of its dimensions, the quotient will be the other dimension.

Q

## EXAMPLES.

1. The length *A B*, of a vessel in the form of a parallelipedon, measures 82 inches, its breadth *A E* 54 inches, and its depth or altitude *B C* 38.5 inches; what is its content in ale and wine gallons, and malt bushels?

*Inches.*

82 *Length.*

54 *Breadth.*

328

410

4428 *product.*

38.5 *depth.*

22140

35424

13294

*Divisor 282* 170478.0 (604.531 content in ale gallons.

Also,  $170478 \div 231 = 738.00$ , the content in wine gallons;  
and  $170478 \div 2150.42 = 79.27$ , the content in malt bushels.

*By the Sliding Rule.*

## RULE I.

As the length on *C*, is to the same on *D*; so is the breadth on *C*, to the mean proportional between the length and breadth, on *D*. (See Prob. X., Part II.)

Then, as the square gauge-point on *D*, is to the depth

on C; so is the mean proportional on D, to the content on C.

On C.    On D.    On C.    On D.  
As 82 : 82 :: 54 : 66.54, the mean proportional.

On D.    On C.    On D.    On C.  
As  $\left\{ \begin{array}{l} 16.79 \\ 15.19 \\ 46.36 \end{array} \right\} : 38.5 :: 66.54 : \left\{ \begin{array}{l} 604.53 \text{ ale gallons.} \\ 738.00 \text{ wine gallons.} \\ 79.27 \text{ malt bushels.} \end{array} \right.$

## RULE II.

As the square divisor on A, is to the length on B; so the breadth on A, to the area of the base on B.

And, as one on A, is to the area of the base on B; so the depth on A, to the content on B.

### Areas.

On A.    On B.    On A.    On B.  
As  $\left\{ \begin{array}{l} 282 \\ 281 \\ 2150.48 \end{array} \right\} : 82 :: 54 : \left\{ \begin{array}{l} 15.70 \text{ ale gallons.} \\ 19.17 \text{ wine gallons.} \\ 2.06 \text{ malt bushels.} \end{array} \right.$

### Contents.

On A.    On B.    On A.    On B.  
As 1 :  $\left\{ \begin{array}{l} 15.70 \\ 19.17 \\ 2.06 \end{array} \right\} :: 38.5 : \left\{ \begin{array}{l} 604.53 \text{ ale gallons.} \\ 738.00 \text{ wine gallons.} \\ 79.27 \text{ malt bushels.} \end{array} \right.$

2. The length of a vessel is 92.8 inches, its breadth 15 inches, and its depth 46.2 inches; what is its content ale and wine gallons, and malt bushels?

Ans. 980.619 ale gallons, 1197.12 wine gallons, and 128.59 malt bushels.

3. A wine-vat measures 104 inches in length, 92.4 inches in breadth, and 38.6 inches in depth; how many gallons of wine will it contain?

Ans. 1605.76 wine gallons.

4. Admit the foregoing figure A B C D E F G to represent a couch, the length of which measures 146 in-

ches, its breadth 92 inches, and its depth 35.6 inches how many bushels of malt will it contain?

*Ans. 222.365 bushels*

5. A floor of malt measures 246 inches in length, 12 in breadth, and 6.8 inches in depth; required its content in malt bushels?

*Ans. 97.236 malt bushels*

6. A stone trough or cistern measures 83.8 inches in length, 45.3 inches in breadth, and holds 436.5 ale gallons; required its depth?

*Ans. 32.646 inches*

### PROBLEM III.

*To find the content of a vessel in the form of a prism.*

#### RULE.

*By the Pen.*

Find the area of the base in ale and wine gallons, and malt bushels; multiply these areas by the perpendicular depth; and the respective products will be the content of the vessel, in ale and wine gallons, and malt bushels.

*Note 1.* If the base be a square, a rectangle, a rhombus, a triangle, a trapezium, a trapezoid, or an irregular polygon, its area may be found by Prob. I., II., III., IV., V., VI., VII., or VIII.; but if the base be a regular polygon, its area may be obtained by Prob. IX. or X., Part IV.

2. A regular prism has all the sides of its base equal to each other; when they are unequal, the prism is irregular.

3. The perpendicular depth of a prismatic vessel may be found by dividing the content by the area of the base.

4. In order to find the content of any prism in cubic feet, find the area of the base in inches, as directed in Note 1; multiply this area by the perpendicular height, and the product will be the content of the prism in cubic inches. Divide this content by 1728, and you will obtain the content in cubic feet. (See Nesbit's Mensuration, Prob. III., Part IV.)

#### EXAMPLES:

1. Let A B C D E F represent a vessel in the form of a triangular prism; required its content in ale and wine gallons, and malt bushels; the perpendicular depth or al-

itude  $AE$ ,  $BF$ , or  $CD$  measuring 65 inches, and each of the equal sides of the base  $ABC$  52 inches?

(See Prob. X., Part IV.)

*Inches.*

*Note.* If it be thought inconvenient to find the area of the base by the Sliding Rule, it may be found by the Pen.

#### Contents.

On A.	On B.	On A.	On B.
As 1 :	$\left\{ \begin{array}{l} 4.15 \\ 5.07 \\ 0.543 \end{array} \right\}$	:: 65 :	$\left\{ \begin{array}{l} 269.96 \text{ ale gallons.} \\ 329.55 \text{ wine gallons.} \\ 35.33 \text{ malt bushels.} \end{array} \right\}$

2. The side of a pentagonal vessel measures 24.5 inches, and its perpendicular depth 57.4 inches; what is the content in ale and wine gallons and malt bushels?

*Ans.* 210.20598935 ale gallons, 256.6159988 wine gallons, and 27.56348 malt bushels.

3. The side of a hexagonal wine-vat measures 32.6 inches, and its perpendicular depth 49.7 inches; what is its content in wine gallons?

*Ans.* 594.057 wine gallons.

4. The three sides of the base of an irregular, prismatic vessel, measure 96, 125, and 159 inches respectively; and its perpendicular depth 38.4 inches; what is its content in ale gallons?

*Ans.* 710.5182 ale gallons.

5. The base of a maltster's cistern is a trapezium, the longer diagonal of which measures 274 inches, one of the perpendiculars 112 inches, and the other 93 inches;

required its content in malt bushels, its depth being 39.4 inches ?

*Ans.* 514.564 malt bushels.

6. An octagonal, prismatic vessel contains 579.8 wine gallons; and the side of its base measures 24.6 inches; required its perpendicular depth ?

*Ans.* 45.797 inches.

## PROBLEM IV.

*To find the content of a vessel in the form of a cylinder.*

### RULE I.

*By the Pen.*

Multiply the square of the diameter by the perpendicular depth; divide the product by 859.05, 294.12, and 2738, and the respective quotients will be the content in ale and wine gallons, and malt bushels.

### RULE II.

Find the area of the base in ale and wine gallons, by the Tables of ale and wine areas, Part VII.; then multiply these areas by the depth, and the respective products will be the content in ale and wine gallons. (See Prob. XIII. Part IV.)

*Note 1.* If the square of the diameter of a cylinder be multiplied by .7854, the product will be the area of the base in square inches; and if this area be multiplied by the depth or altitude, the product will be the content in cubic inches; which being divided by 1728, will give the content in cubic feet.

2. The depth or altitude of a cylinder may be found by dividing the content by the area of the base.

### EXAMPLES.

1. Required the content of the cylindrical vessel A B C D, in ale and wine gallons, and malt bushels; the diameter of the base A B being 54.8 inches, and the depth A D or B C 62.5 inches ?

*By Rule I.*

*Inches.*

1801824

Divisor 359.06)187696.000(522.748 content in ale gallons.

Also,  $18760.000 \div 294.12 = 638.140$ , the content in wine gallons; and  $18760.000 \div 2738 = 68.550$ , the content in malt bushels.

*By Rule II.*

By the Table of ale areas, Part VII., we find the area of the base to be 8.2638 ale gallons; then  $8.2638 \times 62.5 = 516.4875$ , the content in ale gallons.

Again, by the Table of wine areas, Part VII., we find

the area of the base to be 10.2103 wine gallons; then  $10.2103 \times 62.5 = 638.14375$ , the content in wine gallons.

*By the Sliding Rule.*

As the circular gauge-point on D, is to the depth or altitude on C; so is the diameter on D, to the content on C.

	On D.	On C.	On D.	On C.
As	$\left\{ \begin{array}{l} 18.95 \\ 17.15 \\ 52.32 \end{array} \right\}$	: 62.5	:: 54.8 :	$\left\{ \begin{array}{l} 522.74 \text{ ale gallons.} \\ 638.14 \text{ wine gallons.} \\ 68.55 \text{ malt bushels.} \end{array} \right\}$

2. What is the content of a cylindrical guile-tun, in ale gallons; the diameter of the base being 68.6 inches, and the perpendicular depth 74 inches?

*Ans.* 969.895 ale gallons.

3. The depth of a cylindrical vessel is 57.4 inches, and its diameter 43.1 inches; what is the content in wine gallons?

*Ans.* 862.527 wine gallons.

4. A cylindrical mash-tun measures 96.8 inches in diameter, and 84.6 inches in depth; how many bushels of malt will it contain?

*Ans.* 206.094 bushels.

5. At Heidelberg, in Germany, is a cylindrical wine-cask, the perpendicular height of which measures 27 feet or 324 inches, and the diameter 21 feet or 252 inches; how many wine gallons will it hold?

*Ans.* 69955.446 wine gallons.

*Note.* This convivial monument of ancient hospitality, was formerly kept full of the best Rhenish wine, and the electors have given many entertainments on its platform; but it now only serves as a melancholy instance of the extinction of that hospitality; for it is suffered to moulder in a damp vault, quite empty.

Although this vessel is of an extraordinary magnitude; yet it is much inferior, in capacity, to many of the London porter-vats.

## PROBLEM V.

*To find the content of a vessel in the form of a pyramid.*

### RULE.

*By the Pen.*

Multiply the area of the top of the vessel, in square

inches, by the perpendicular depth, and  $\frac{1}{3}$  of the product will be the content in cubic inches. Divide this content by 282, 231, and 2150.42; and the respective quotients will be the content in ale and wine gallons, and malt bushels.

*Note 1.* If the perpendicular depth will divide by 3, the content may be found by multiplying the area of the top by  $\frac{1}{3}$  of the perpendicular depth.

2. The area of the top may be found by Prob. IX. or X., Part IV (See Note 1., Prob. III.)

3. Vessels in the form of pyramids and cones are seldom met with in the Practice of Gauging; and it is evident, from the nature of the figures, that they must always be placed with their bases upwards, and their vertices downwards, like wine-glasses, silver-cups, &c. &c.; consequently what is called the base of a pyramid or cone, in the Mensuration of Solids, will become the top of a pyramidal or conical vessel, in Gauging.

4. If the area of the top, in ale and wine gallons, and malt bushels be multiplied by  $\frac{1}{3}$  of the perpendicular depth in inches, the respective products will be the content in ale and wine gallons, and malt bushels.

#### EXAMPLES.

1. Required the content of the hexagonal pyramidal vessel A B C D E F G, in ale and wine gallons, and malt bushels; each side of the top measuring 46 inches, and the perpendicular depth H G, 90.3 inches?

(See Prob. X., Part IV.)

On A.	On B.	On A.	On C.
As 1 :	$\left\{ \begin{array}{l} 19.49 \\ 23.79 \\ 2.556 \end{array} \right\}$	:: 30.1 :	$\left\{ \begin{array}{l} 586.79 \text{ ale gallons.} \\ 716.34 \text{ wine gallons.} \\ 76.939 \text{ malt bushels.} \end{array} \right\}$

*Note.* If the top of a pyramidal vessel be a square, the proportion by the Sliding Rule will be, As the square gauge-point on D, is to  $\frac{1}{3}$  of the perpendicular depth on C; so is the side of the top on D, to the content on C.

2. The perpendicular depth of a square, pyramidal vessel is 126 inches, and the side of its top 52.5 inches; what is the content in wine gallons?

*Ans.* 501.13 wine gallons.

3. The three sides of the top of a triangular, pyramidal vessel are 46, 48, and 54 inches, and its perpendicular depth 75 inches; what is the content in malt bushels?

*Ans.* 12.066 malt bushels.

## PROBLEM VI.

*To find the content of a vessel in the form of the frustum of a pyramid.*

## RULE I.

*General Rule by the Pen.*

To the sum of the areas of the two ends, add the square root of their product; multiply this sum by  $\frac{1}{3}$  of the perpendicular depth, and the product will be the content in cubic inches. Divide this content by 282, 231, and 2150.42, respectively; and the quotients will be the content in ale and wine gallons, and malt bushels.

*Note 1.* The areas of the ends must be found as directed in Note 1, Prob. III.

2. The above Rule is general, whatever may be the form of the two similar ends of the frustum; that is, whether they be polygons, circles, or ellipses.

## RULE II.

*When the ends are regular polygons.*

Add together the square of a side of each end, and the product of those sides; multiply the sum by  $\frac{1}{3}$  of the depth, and this product by the tabular areas belonging to the polygon, (Prob. X., Part IV. ;) and the respective products will be the content in ale and wine gallons, and malt bushels.

## EXAMPLES.

1. What is the content in ale and wine gallons, and malt bushels, of the vessel A B C D E F G, in the form of the frustum of a square pyramid; the side A B of the greater end being 56 inches, the side D E of the lesser end 32 inches, and the perpendicular depth H  $\pi$ , 96 inches?

R

*By Rule I.*

Here  $56 \times 56 = 3136$ , the area of the greater end ;  $32 \times 32 = 1024$ , the area of the less end ; and  $\sqrt{3136 \times 1024} = \sqrt{3211264} = 1792$ , the square root of their product ; then  $(3136 + 1024 + 1792) \times 98 \div 3 = 5952 \times 98 \div 3 = 583296 \div 3 = 194432$ , the content in cubic inches. Hence  $194432 \div 288 = 675.111$ , the content in ale gallons ;  $194432 \div 231 = 841.696$ , the content in wine gallons ; and  $194432 \div 2150.4 = 90.415$ , the content in malt bushels.

*By Rule II.*

Here  $56 \times 56 = 3136$ , the square of a side of the greater end ;  $32 \times 32 = 1024$ , the square of a side of the less end ; and  $56 \times 32 = 1792$ , the product of the sides ; then  $(3136 + 1024 + 1792) \times 98 \div 3 = 5952 \times 98 \div 3 = 583296 \div 3 = 194432$ , the content in cubic inches. Hence  $194432 \times .003546 = 689.455$ , the content in ale gallons ;  $194432 \times .004329 = 841.696$ , the content in wine gallons ; and  $194432 \times .000465 = 90.410$ , the content in malt bushels.

*By the Sliding Rule.*

Take the areas of the two ends, and also a geometrical

mean between those areas; add those three numbers together; multiply the sum by one-third of the perpendicular depth; and the product will be the content.

*Note.* If the ends be squares, their areas may be found by Prob. I.; and if they be regular polygons, their areas may be obtained by Prob. IX. or X., Part IV. A geometrical mean proportional between the areas of the ends, may be found by Prob. I., Part I., or Prob. X., Part II.

### *Ale Gallons.*

$$\begin{array}{rcll}
 \text{On A.} & \text{On B.} & \text{On A.} & \text{On B.} \\

 \text{As } 1 : 25.75 :: 32.66 : 841.0 \text{ content.}
 \end{array}$$

*Note.* In finding the areas of the ends, in ale gallons, the square divisor 282 is used; but in finding their areas in wine gallons, the square gauge-point 15.19 is used.

It may also be observed that the content in malt bushels may be obtained by either of the above methods.

2. What is the content of a hexagonal wine-vat; each side of the greater end being 92 inches, each side of the less end 54 inches, and the perpendicular depth 126 inches?

*Ans.* 7722.370 wine gallons.

3. Required the content of an octagonal vessel, in ale and wine gallons, and malt bushels; each side of the

greater base being 35 inches, each side of the less base 28 inches, and the perpendicular depth 94 inches?

*Ans.* 1603.566 ale gallons, 1957.588 wine gallons, and 210.256 malt bushels.

## PROBLEM VII.

*To find the content of a vessel in the form of a cone.*

### RULE I.

*By the Pen.*

Multiply the square of the diameter of the top of the vessel, by  $\frac{1}{3}$  of the perpendicular depth; divide the product by 359.05, 294.12, and 2738; and the respective quotients will be the content in ale and wine gallons, and malt bushels.

### RULE II.

By Problem XIII., Part IV., find the area of the top of the vessel, in ale and wine gallons, and malt bushels; multiply these areas by  $\frac{1}{3}$  of the perpendicular depth; and the respective products will be the content in ale and wine gallons, and malt bushels.

*Notes* 1. If the square of the diameter of the base of a cone be multiplied by .7854, the product will be the area of the base in square inches. Multiply this area by  $\frac{1}{3}$  of the cone's perpendicular height, and the product will be the content in cubic inches; which being divided by 1728, will give the content in cubic feet. (See Nesbit's Mensuration, Prob. VII., Part IV.)

2. The area of the top of a vessel in the form of an elliptical cone may be found by Prob. XVI., Part IV.; and hence the content may be obtained by Rule II.

### EXAMPLES.

1. The diameter A B, of the top of a conical vessel, is 46 inches, and the perpendicular depth D C, 78 inches; what is the content in ale and wine gallons, and malt bushels?

*By Rule I.*

*Inches.*

*46 diameter of the top.*

*46 ditto.*

276

184

2116 *square of the diameter.*

*26 one-third of the depth.*

12696

4282

*Divisor 359.05* 55016 *(153.226 ale gallons.*

*rain,  $55016 \div 294.12 = 187.052$ , the content in wine  
ns; and  $55016 \div 2738 = 20.098$ , the content in malt  
ls.*

*By Rule II.*

*ere  $46 \times 46 \times .002785 = 2116 \times .002785 = 5.898060$ , the  
of the base in ale gallons;  $2116 \times .003899 = 7.192284$ ,  
rea of the base in wine gallons; and  $2116 \times .000865$   
72340, the area of the base in malt bushels. Hence,  
 $3060 \times 26 = 158.219560$ , the content in ale gallons;*

R 8

$7.192284 \times 26 = 186.999384$ , the content in wine gallons  
and  $.772340 \times 26 = 20.080840$ , the content in malt bushels.

*By the Sliding Rule.*

As the circular gauge-point on D, is to  $\frac{1}{2}$  of the perpendicular depth on C; so is the diameter on D, to the content on C.

	On D.	On C.	On D.	On C.
<i>As</i>	$\left\{ \begin{array}{l} 18.95 \\ 17.15 \\ 52.32 \end{array} \right\}$	$: 26 ::$	$46 :$	$\left\{ \begin{array}{l} 153.21 \text{ ale gallons.} \\ 186.99 \text{ wine gallons.} \\ 20.08 \text{ malt bushels.} \end{array} \right\}$

2. The diameter of the top of a conical vessel measures 84 inches, and the length of its slant side 112 inches; what is the content in ale gallons?

*Ans.* 680.1115 ale gallon

3. The perpendicular depth of a conical vessel is 9 inches, and the circumference of the top 216 inches required the content in malt bushels?

*Ans.* 55.232 malt bushel

## PROBLEM VIII.

*To find the content of a vessel in the form of the frustum of a cone.*

### RULE I.

*By the Pen.*

To three times the product of the top and bottom diameters, add the square of their difference; multiply the sum by the perpendicular depth; divide the product by 1077.15, 882.36, and 8214; and the respective quotient will be the content in ale and wine gallons, and malt bushels.

## RULE II.

From the square of the sum of the top and bottom diameters, subtract the product of those diameters; multiply the remainder by the perpendicular depth; divide the product by the foregoing divisors; and you will obtain the content in ale and wine gallons, and malt bushels.

*Note 1.* The General Rule given in Prob. VI., will also give the content of a vessel in the form of the frustum of a cone, whether the ends be circular or elliptical.

2. When the ends are elliptical, their areas must be found by Prob. I., Part IV.

3. The equal frustums of two similar cones, joined together at their outer ends, form a figure, which, by Gaugers, is called a cask of the fourth variety. This variety, however, is seldom, or perhaps never met with in Practice.

## EXAMPLES.

1. What is the content in ale and wine gallons, and malt bushels, of the vessel A B C D, in the form of the frustum of a cone; the diameter A B of the bottom being 36 inches, the diameter C D of the top 40 inches, and the perpendicular depth E = 86 inches?

*By Rule I.**Inches.*

72 the bottom diameter.

40 the top diameter.

32 difference,

32 ditto.

64

*Note.* The content in malt bushels, may be found by a similar process.

2. The top diameter of a guile-tun is 60 inches, the bottom diameter 40 inches, and the perpendicular depth 74 inches; what is the content in ale gallons?

*Ans.* 522.118 ale gallons.

3. What is the content, in malt bushels, of a vessel whose top diameter is 40 inches, bottom diameter 36 inches, and depth 52 inches?

*Ans.* 27.449 malt bushels.

## PROBLEM IX.

*To find the content of a vessel in the form of a prismoid.*

## RULE.

*By the Pen.*

To the sum of the areas of the two ends, add four times the area of a section parallel to, and equally distant from both ends; multiply this sum by the perpendicular depth, and  $\frac{1}{3}$  of the product will be the content in cubic inches. Divide this content by 282 for ale gallons, 291 for wine gallons, and 2150.42 for malt bushels.

*Note 1.* The length of the middle section is equal to half the sum of the lengths of the two ends; and its breadth is equal to half the sum of their breadths.

2. If the ends be elliptical, the transverse diameter of the middle section will be equal to half the sum of the transverse diameters of the two ends; and the conjugate diameter equal to half the sum of the conjugate diameters of the two ends.

3. If one end be an ellipse and the other a circle, add the transverse diameter of the elliptical end to the diameter of the circular end; and

*e* half the sum for the transverse diameter of the middle section.  
*c* conjugate diameter of the middle section must be found in a similar manner.

*n* If the square of the diameter of a circle be multiplied by .7854, product will be the area in square inches; and if the rectangle of two diameters of an ellipse be multiplied by .7854, the product be the area in square inches. (See Problems XIII. and XVI., (IV.)

### SCHOLIUM.

The Rule given in this Problem for a prismoid, is very fully demonstrated in Simpson's Fluxions, page 178, 1st edition; and also in a similar manner at page 302, of Hiday's Fluxions.

There is likewise a very elegant demonstration given Proposition III., Section I., Part IV., of Dr. Hutton's Mensuration, third edition, in which it is shewn to be true for all frustums whatever, and for all solids whose parallel sections are similar figures; and Mr. Fletcher, in the second edition of his Universal Measurer, Part III., page 54, and Mr. Moss, in his Gauging, page 175, third edition, say, that it is *nearly* true for any other solid, whatever may be its form.

### EXAMPLES.

1. Required the content, in ale and wine gallons, and in bushels, of the prismoidal vessel A B C D E F G; length A B of its bottom being 40, and its breadth B C 21 inches; the length C F of its top 52, and its width F E 25 inches, and the perpendicular depth A E 12 inches?

Here  $40 \times 21 = 840$ , the area of the bottom; and  $52 \times 25 = 1300$ , the area of the top of the vessel.

Also  $\frac{40 + 52}{2} = \frac{92}{2} = 46$ , the length of the middle section;

and  $\frac{21 + 25}{2} = \frac{46}{2} = 23$ , the breadth of the middle section;

then  $46 \times 23 \times 4 = 1058 \times 4 = 4232$ , four times the area of the middle section; whence  $(840 + 1300 + 4232) \times \frac{60}{6} = 6372 \times$

$10 = 63720$ , the content in cubic inches; and  $63720 \div 282 = 225.957$ , the content in ale gallons;  $63720 \div 231 = 275.844$ , the content in wine gallons; and  $63720 \div 2150.42 = 29.631$ , the content in malt bushels.

### By the Sliding Rule.

By Problem II., Part IV., find the areas of the two ends; and also the area of the middle section. Add the areas of the two ends, and four times the area of the middle section, together; then say, as six on A, is to the sum of these areas on B; so is the perpendicular depth on A, to the content on B.

### Ale Gallons.

On A.	On B.	On A.	On B.
As 282:	46	::	23

				{ 4.61 area of the top.
				{ 2.98 area of the bottom.
				<u>22.59 sum.</u>

As 6 : 22.59 :: 60 : 225.90 content.

**Wine Gallons.**

**On A.   On B.   On A.   On B.**

231: 46 :: 23 : 4.58 *area of the middle section.*  
*4 multiply by four.*

**18.32** *four times the area of ditto.*

$$231: \left\{ \begin{array}{c} 52 \\ 40 \end{array} \right\} :: \left\{ \begin{array}{c} 25 \\ 21 \end{array} \right\} : \left\{ \begin{array}{c} 5.63 \text{ area of the top.} \\ 3.64 \text{ area of the bottom.} \\ \hline 27.59 \text{ sum.} \end{array} \right.$$

**4,6 : 27.59 :: 60 : 275.90 content.**

**Note.** The content in malt bushels may be found by a similar

2. The length and breadth of the bottom of a vessel the form of a prismoid, are 42.5 and 38.4 ; the length and breadth of the top 54.6 and 42.2 ; and the depth 54 inches ; what is the content in ale gallons ?

**Ans. 375.395 ale gallons.**

3. The length and breadth of the top of a cistern, in form of a prismoid, measure 70 and 56; the length and breadth of the bottom 66 and 53.8; and the depth 12 inches; what is the content in malt bushels?

**Ans. 83.345 malt bushels.**

6. The perpendicular depth of a vessel, in the form of frustum of an elliptical cone, is 46.8 inches; the transverse and conjugate diameters of the bottom measure 49.6 and 37.8 inches; the transverse and conjugate diameters of the top, 67.2 and 50.4 inches; required the content in ale and wine gallons?

Ans. The content is 338.099 ale gallons, and 412.744 we gallons.

5. The perpendicular depth of a vessel with an elliptical base and a circular top, generally called a cylindroid, is 52.6 inches; the transverse and conjugate diameters of the bottom measure 61.6 and 46.2 inches; and the diameter of the top measures 42.6 inches; required the content in ale and wine gallons?

*Ans. The content is 339.716 ale gallons, and 414.719 wine  
lons.*

## REMARKS.

It is evident that the middle section of the cylindroid, in the last question, cannot be a *true* ellipse, because the top of the vessel is a circle; consequently, the area of the middle section cannot be correctly found by the Rule for the ellipse.

Now, as we have not the *true* area of the middle section, the content of the vessel, found by the Rule given in this Problem, is not *mathematically* correct; although it is near enough the truth for all practical purposes.

If the true areas of all the horizontal sections of *any* vessel can be obtained, either by equi-distant ordinates, as directed in Problem XX., Part IV., or by any other method; then the Rule given in this Problem, will give *very nearly* the true content of the vessel. (See the foregoing Scholium.)

## PROBLEM X.

*To find the content of a vessel in the form of a sphere or globe.*

## RULE I.

*By the Pen.*

Multiply the cube of the diameter by .5236, and the product will be the content in cubic inches; which divide by 282, 231, and 2150.42, and the respective quotients will be the content in ale and wine gallons, and malt bushels.

## RULE II.

Multiply the cube of the diameter by .0018567, .00227, and .000243, or divide it by 538.58, 441.18, and 4107; and the respective products or quotients will be the content in ale and wine gallons, and malt bushels.

*Note 1.* As every sphere is equal to two-thirds of its circumscribing

Under, it is evident that  $\frac{1}{3}$  of the circular multipliers will be the multipliers for a sphere, as given in the last Rule.

The divisors for a sphere must also be in the same ratio, but inversely; hence  $\frac{1}{3}$  of the circular divisors will be the divisors for a sphere, as given in the same Rule.

The gauge-points for a sphere are obtained by extracting the square roots of the divisors; and are found to be 23.2 for ale, 21.0 for wine gallons, and 64.1 for malt bushels.

Vessels in the form of a sphere or globe are seldom met with in practice; and when they are, it is evident they must have bung-holes in the ends.

## EXAMPLES.

What is the content of the spherical vessel A B C D, in ale and wine gallons, and malt bushels; if the inner diameter A C, measure 52 inches?

By Rule I.

Here  $52^3 = 52 \times 52 \times 52 = 140608$ , the cube of the diameter; and  $140608 \times .5236 = 73622.3488$ , the content in

inches; then  $\frac{73622.3488}{282} = 261.072$ , the content in ale

as;  $\frac{73622.3488}{231} = 318.711$ , the content in wine gal-

; and  $\frac{73622.344}{2150.42} = 34.236$ , the content in malt bushels.

*By Rule II.**By Multiplication.*

Here  $140608 \times .0018567 = 261.0668736$ , the content in ale gallons;  $140608 \times .00227 = 319.18016$ , the content in wine gallons; and  $140608 \times .000243 = 34.167744$ , the content in malt bushels.

*By Division.*

Here  $140608 \div 538.58 = 261.071$ , the content in ale gallons;  $140608 \div 441.18 = 318.708$ , the content in wine gallons; and  $140608 \div 4107 = 34.236$ , the content in malt bushels.

*By the Sliding Rule.*

As the gauge-point on D, is to the diameter on C; so is the diameter on D, to the content on C. (See Note 2.)

	On D.	On C.	On D.	On C.
As	{ 23.2 21.0 64.1 }	: 52 ::	52 :	{ 261.07 ale gallons.
				{ 318.71 wine gallons.
				{ 34.24 malt bushels.

*Note.* The content of a sphere may also be found by saying, As the circular gauge-point on D, is to two-thirds of the diameter on C; so is the diameter on D, to the content on C.

2. Required the content of a spherical vessel, in ale gallons; when the inner diameter measures 116 inches?

*Ans.* 2898.174 ale gallons

3. The inner diameter of a spherical vessel is 16.1 inches; what is the content in malt bushels?

*Ans.* 1.014 malt bushels

**PROBLEM XI.**

*To find the content of a vessel in the form of the segment of a sphere.*

**RULE I.***By the Pen.*

To three times the square of the radius of the top of

the vessel, add the square of its depth; multiply this sum by the depth; and the product again by .5236, and you will obtain the content in cubic inches. Divide this content by 288, 231, and 2150.42; and the respective quotients will be the content in ale and wine gallons, and malt bushels.

*Note 1.* A vessel in the form of the segment of a sphere may be placed with the convex part either upwards or downwards. If the convex part be placed upwards, the vessel must evidently have a bung-hole at the top; but if the vessel be placed with the convex part downwards, it may be open at the top, as in the following figure. (See Problems V., VII., and XVII.)

2. When a vessel in the form of the segment of a sphere, is placed with its convex part upwards; it is evident that the part which is denominated the top of the vessel, in the above Rule, will become the base.

### **RULE II.**

To the square of the diameter of the top of the vessel, add the square of the depth, and one-third of the same; this sum being multiplied by half the depth, and the product divided by 359.05, 294.12, and 2738, will give the content in ale and wine gallons, and malt bushels.

*Note 1.* Both the foregoing Rules are true when the segment is greater than a semi-sphere.

2. The altitude of the remaining segment may be found by dividing the square of  $AB$  by  $Cn$ . (See the next figure; and also Theorems IX. and XII., Part III.)

### **EXAMPLES.**

1. The diameter  $AB$ , of the top of a vessel, in the form of the segment of a sphere, measures 120 inches, and the perpendicular depth  $Cn$ , 24 inches; what is the content in ale gallons?

*By Rule I.*

Here  $60^2 \times 3 = 360 \times 3 = 10800$ , three times the square half the diameter of the top; also,  $24^2 = 576$ , the square of the depth; then  $(10800 + 576) \times 24 \times .5236 = 11376 \times 24 \times .5236 = 273024 \times .5236 = 142955.3664$ , the content cubic inches; hence  $142955.3664 \div 282 = 506.933$ , the content in ale gallons.

*By Rule II.*

Here  $120 \times 120 = 14400$ , the square of the diameter of the top; and  $24 \times 24 = 576$ , the square of the depth; also  $\frac{576}{3} = 192$ , one-third of the square of the depth; then  $(14400 + 576 + 192) \times 12 = 15168 \times 12 = 182016$ ; and  $182016 \div 359.05 = 506.937$ , the content in ale gallons.

*By the Sliding Rule.*

By Problem XIII., Part IV., find the area of the segment's base or top; and also the area of a circle equal in diameter to the segment's height. To the sum of these two areas add one-third of the latter area; multiply the sum thus obtained by one-half of the height; and the product will be the content.

*Note.* This method of finding the content by the Sliding Rule, is founded on Rule II.

On D.	On C.	On D.	On C.
As 18.95	: 1	:: { 120 } : { 40.10 area of the top.	
		{ 24 } : { 1.60 ditto of a circle.	
		.53 one-third of ditto.	
		<u>42.23</u> sum in ale gallons.	

On A.	On B.	On A.	On B.
As 1	: 42.23	:: 12	: 506.76 content in ale gallons.

*Note.* The content in wine gallons and malt bushels, may be obtained by a similar process.

2. The diameter of the top of a vessel, in the form of the segment of a sphere, measures 48 inches, and its depth 21 inches ; what is the content in wine gallons ?

*Ans.* 103.244 wine gallons.

3. The altitude of a segment of a sphere is 15 inches, and the diameter of the base 38 inches ; what is the content in malt bushels ?

*Ans.* 4.777 malt bushels.

## PROBLEM XII.

*To find the content of a vessel in the form of the frustum or zone of a sphere.*

### RULE.

*By the Pen.*

To half the sum of the squares of the two diameters, add  $\frac{1}{2}$  of the square of the depth of the vessel ; multiply the sum by the depth ; and divide the product by 359.05 for ale gallons, 294.12 for wine gallons, and 2738 for malt bushels.

### EXAMPLES.

1. What is the content, in ale gallons, of the vessel ABCD, in the form of the frustum of a sphere ; the bottom diameter AB being 42 inches, the top diameter CD 36 inches ; and the perpendicular depth  $mn$  30 inches ?

Here  $\frac{42^2 + 36^2}{2} = \frac{1764 + 1296}{2} = \frac{3060}{2} = 1530$ , half the sum of the squares of the two diameters; and  $30^2 \times \frac{2}{3} = 900 \times \frac{2}{3} = \frac{1800}{3} = 600$ , two-thirds of the square of the depth; then  $1530 + 600 \times 30 = 2130 \times 30 = 63900$ ; and  $63900 \div 359.05 = 177.969$ , the content in ale gallons.

*By the Sliding Rule.*

By Problem VIII., Part II., find the squares of the diameters of the two ends, and also the square of the altitude. To half the sum of the squares of the diameters, add two-thirds of the square of the altitude; then say, As the circular divisor on A, is to this sum on B; so is the altitude of the zone on A, to the content on B.

*Note.* This method of obtaining the content by the Sliding Rule, is founded on the preceding Rule, given for the Pen.

On D.	On C.	On D.	On C.
As 1	: 1	:: { 42 } : { 1764 the sq. of the greater diameter	
		{ 36 } : { 1296 the sq. of the less ditto.	
		2)3060 sum.	
		<u>1530 half the sum.</u>	

On D.	On C.	On D.	On C.
As 1	: 1	:: 30 : 900 the square of the altitude.	
		2	
		3)1800	
		600 two-thirds of ditto.	
Add.....		1530 brought down.	
		<u>2130 sum.</u>	

On A.	On B.	On A.	On B.
As 359.05	: 2130	:: 30 : 177.92 the content in ale gallons.	

*Note* The content in wine gallons and malt bushels, may be found by a similar process.

2. What is the content, in wine gallons, of a vessel in the form of the frustum of a sphere; the greater diameter being 52 inches, the less diameter 30 inches, and the depth 18 inches? *Ans.* 123.500 wine gallons.

3. The top and bottom diameters of the frustum of a sphere are 24 and 25 inches, and the altitude 20 inches; what is the content in malt bushels?

*Ans.* 6.334 malt bushels.

### PROBLEM XIII.

*To find the content of a vessel in the form of a prolate spheroid.*

#### RULE.

*By the Pen.*

Multiply the square of the conjugate diameter by the transverse diameter; and divide the product by 538.58 for ale gallons, 441.18 for wine gallons, and 4107 for malt bushels.

*Note 1.* A spheroid is equal to  $\frac{4}{3}$  of its circumscribing cylinder; hence the same multipliers, divisors, and gauge-points, are used for the spheroid that are used for the sphere. (See Problem X.)

2. Vessels in the form of an oblate spheroid are never met with in Gauging.

#### EXAMPLES.

1. What is the content of the spheroidal vessel A B C D, in ale gallons; the transverse diameter A C being 54 inches, and the conjugate diameter B D 38 inches?

Here  $38 \times 38 \times 54 = 1089 \times 54 = 58806$ ; then  $\frac{58806}{538.5} = 109.187$ , the content in ale gallons.

*By the Sliding Rule.*

As the gauge-point on D, is to the transverse diameter on C; so is the conjugate diameter on D, to the content on C.

On D. On C. On D. On C.  
As 23.19 : 54 :: 33 : 109.19 the content in ale gallons.

*Note 1.* The content in wine gallons and malt bushels may be found in a similar manner.

2. The content of a spheroid may also be found by saying, As the circular gauge-point on D, is to two-thirds of the transverse diameter on C; so is the conjugate diameter on D, to the content on C.

2. Required the content, in wine gallons, of a spheroid whose transverse diameter is 72.5, and conjugate 56 inches?  
*Ans. 515.345 wine gallons*

3. If the transverse diameter of a vessel, in the form of a spheroid, be 48 inches, and the conjugate 42 inches, what is the content in malt bushels?  
*Ans. 20.616 malt bushels*

**REMARK.**

The content of a vessel in the form of a prolate semi-spheroid, may be found by the following Rule: Multiply the square of the diameter of the base by the perpendicular height; divide the product by 588.58, 441.18, and 4107; and the respective quotients will be the content of the vessel, in ale and wine gallons, and malt bushels.

*Note.* Any diameter parallel to the base of a vessel, in the form of a prolate semi-spheroid, may be found by the following Rule: To the altitude of the given vessel, add the distance between its base and the required diameter; and from the altitude subtract the said distance; multiply the sum by the remainder, and extract the square root of the product. Then say, as twice the altitude of the given vessel, is to the diameter of its base; so is twice the above root, to the diameter required.

**PROBLEM XIV.**

*Find the content of a vessel in the form of the middle frustum of a prolate spheroid.*

**RULE.**

*By the Pen.*

twice the square of the middle diameter add the square of the diameter of the end; multiply the sum by the length of the frustum; divide the product by 5, and 892.36; and the respective quotients will be the content in ale and wine gallons.

1. If the content be required in malt bushels, the divisor will be

the above divisors are obtained by multiplying 359.05, 294.12, 38, the circular divisors, for ale and wine gallons, and malt by three.

A cask in the form of the middle frustum of a prolate spheroid is called a cask of the *first variety*.

**EXAMPLES.**

What is the content in ale and wine gallons, of the cask E G H F, in the form of the middle frustum of a prolate spheroid; the middle diameter C D being 36, the diameter of the end E F or G H 27, and the length 40 inches?

*Middle diameter.*

$$\begin{array}{r}
 \text{Inches.} \\
 36 \\
 36 \\
 \hline
 216 \\
 108 \\
 \hline
 1296 \text{ square.} \\
 2 \\
 \hline
 2592 \text{ twice the sq. of the middle diam.} \\
 27 \times 27 = 729 \text{ the square of the end diameter.} \\
 \hline
 3321 \text{ sum.} \\
 40 \text{ the length.}
 \end{array}$$

*Divisor 1077.15)132840(123.325, the content in ale gall.*

*Also,  $132840 \div 882.36 = 150.550$ , the content in wine gallons.*

*By the Sliding Rule.*

Multiply the difference between the middle and end diameters by .68, when that difference is less than 6 inches, but by .7, when it exceeds 6 inches; add the product to the less diameter, and the sum will be the mean diameter; then say, as the circular gauge-point on D, is to the length on C; so is the mean diameter on D, to the content on C.

*Note.* The multipliers given in this Problem, and some of the following Problems, are the same that are used in Cask Gauging, in order to reduce casks of different varieties, to cylinders of equal capacities, by finding mean diameters.

$$\begin{array}{rcl}
 \text{On A.} & \text{On B.} & \text{On A.} & \text{On B.} \\
 \text{As } 1 & : 9 :: .7 & : 6.3 \text{ the product.} \\
 \text{Add.....} & & 27.0 \text{ the end diameter.} \\
 & & \hline
 & & 33.3 \text{ the mean diameter.} \\
 & & \hline
 \end{array}$$

$$\begin{array}{rcl}
 \text{On D.} & \text{On C.} & \text{On D.} & \text{On C.} \\
 \text{As } \left\{ \begin{array}{l} 18.95 \\ 17.15 \end{array} \right\} & : 40 :: 33.3 & : \left\{ \begin{array}{l} 123.32 \text{ ale gallons.} \\ 150.55 \text{ wine gallons.} \end{array} \right.
 \end{array}$$

Required the content in ale gallons, of a vessel in form of the middle frustum of a prolate spheroid; diameter of each end being 20, the middle diameter and the perpendicular depth 25 inches?

*Ans. 36.020 ale gallons.*

Suppose the head diameter of a spheroidal cask be the bung diameter 35, and the length 38 inches; is the content of the cask in wine gallons?

*Ans. 144.272 wine gallons.*

*e.* This question is also given in Problem XIX., where the content is found to be the same as above.

The diameter of each end of a vessel in the form of the middle frustum of a prolate spheroid, is 40 inches, the middle diameter 52 inches and the depth 58 inches; what is the content in malt bushels? *Ans. 49.484 malt bushels.*

#### REMARK.

The content of a vessel in the form of half the middle frustum of a prolate spheroid, may be found by the following Rule: To twice the square of the greater diameter add the square of the less diameter; multiply the sum by the perpendicular depth; divide the product by 15, 882.36, and 8214; and the respective quotients will be the content in ale and wine gallons, and malt bushels.

It may also be observed, that if the content thus found, be subtracted from the content of the semi-spheroid, the remainder will be the content of the segment of the spheroid, cut off by the less diameter of half the middle frustum. (See the Remark at the end of the last problem.)

#### PROBLEM XV.

Find the content of a vessel in the form of a parabolic spindle.

#### RULE.

*By the Pen.*

Multiply the square of the middle diameter by the

**T**

length of the spindle; and that product being divided by 678.22, 551.48, and 5138.75, will give the content in ale and wine gallons, and malt bushels.

*Note 1.* A parabolic spindle is equal to  $\frac{1}{2}$  of its circumscribed cylinder; hence the above divisors are obtained by multiplying the circular divisors 259.05, 294.12, and 2788, by 15, and dividing the products by 8; or by multiplying the circular divisors by 1.875, which equal to  $\frac{15}{8}$ .

2. The gauge-points are the square roots of the divisors; and are found to be 25.9 for ale gallons, 23.5 for wine gallons, and 71.65 for malt bushels.

#### EXAMPLES.

1. The length A B, of a vessel in the form of a parabolic spindle, is 70, and the middle diameter C D 28 inches: what is the content in ale gallons?

Here  $28 \times 28 = 784$ , the square of the middle diameter, and  $784 \times 70 = 54880$ , the square of the diameter multiplied by the length; then  $54880 \div 673.22 = 81.518$ , the content in ale gallons.

#### *By the Sliding Rule.*

As the gauge-point on D, is to the length on C; so is the middle diameter on D, to the content on C.

On D.    On C.    On D.    On C.  
As 25.9 : 70 :: 28 : 81.52 ale gallons.

2. The length of a vessel in the form of a parabolic spindle is 65 inches, and its middle diameter 24 inches; what is its content in wine gallons?

*Ans.* 67.890 wine gallons.

3. The length of a vessel in the form of a parabolic spindle is 150 inches, and its middle diameter 56 inches; what is its content in malt bushels?

*Ans.* 91.628 malt bushels.

### PROBLEM XVI.

*To find the content of a vessel in the form of the middle frustum of a parabolic spindle.*

#### RULE.

*By the Pen.*

Add 8 times the square of the middle diameter, 3 times the square of the end diameter, and 4 times the product of those diameters into one sum. Multiply this sum by the length; divide the product by 5385.75, 4411.80, and 41070; and the respective quotients will be the content in ale and wine gallons, and malt bushels.

*Note 1.* A cask in the form of the middle frustum of a parabolic spindle, is called a cask of the second variety.

2. The foregoing divisions are found by multiplying the circular divisors by fifteen.

#### EXAMPLES.

1. The length  $AB$  of the vessel  $EGHF$ , in the form of the middle frustum of a parabolic spindle, measures 40, the middle diameter  $CD$  36, and the end diameter  $EF$ , or  $GH$ , 27 inches; what is the content in ale and wine gallons?

*Middle Diameter.**Inches.*

Divisor 5385.75)657720(122.122, the content in ale gallons.

Divisor 4411.8)657720(149.082, the content in wine gallons.

*By the Sliding Rule.*

Multiply the difference between the two diameters by .62, when that difference is less than 6 inches, but by .64, when it exceeds 6 inches; add the product to the less diameter, and the sum will be the mean diameter; then say, As the circular gauge-point on D, is to the length on C; so is the mean diameter on D, to the content on C.

On A.	On B.	On A.	On B.
As 1	: 9	:: .64	: 5.76 the product.
Add .....			27.0 the less diameter.
			<u>32.76 the mean diameter.</u>

On D.	On C.	On D.	On C.
As { 18.95 }	: 40	:: 32.76	: { 120.0 ale gallons.
{ 17.15 }			{ 146.5 wine gallons.

*Note.* Here the contents found by the Rule are two ale gallons, and two and a half wine gallons less than those found by the Pen. These differences arise from the mean diameter being rather too small.

2. The head diameter of a cask, in the form of the middle frustum of a parabolic spindle, is 22 inches, the bung diameter 27 inches, and the length 80 inches; what is the content in ale and wine gallons?

*Ans.* 58.808 ale gallons, and 65.688 wine gallons.

3. The top diameter, and also the bottom diameter of a vessel in the form of the middle frustum of a parabolic spindle, measures 20 inches, the middle diameter 25 inches, and the depth 27 inches; what is the content in malt bushels?

*Ans.* 5.890 malt bushels.

## PROBLEM XVII.

To find the content of a vessel in the form of a parabolic conoid.

### RULE.

*By the Pen.*

Multiply the square of the diameter of the top of the vessel by half the depth; and divide the product by 359.05 for ale gallons, 294.12 for wine gallons, and 2738 for malt bushels.

*Note 1.* The above Rule will also give the content of the segment of a paraboloid.

2. A paraboloid is equal to half its circumscribing cylinder.

3. A vessel in the form of a paraboloid, may be placed with its vertex either upwards or downwards. If placed with its vertex upwards, the square of the diameter of the base must be multiplied by

half the perpendicular height ; and the product divided by the respective divisors, in order to obtain the content. (See Problems V., VII and XI.)

4. Any diameter parallel to the base of a vessel, in the form of paraboloid, may be found by the following Rule : From the perpendicular altitude of the given vessel, subtract the distance between the base and the required diameter ; and reserve the remainder. Then say, as the perpendicular altitude of the given vessel, is to the square of the diameter of its base ; so is the reserved remainder, to the square of the required diameter. Hence the square root of this number will be the diameter sought.

#### EXAMPLES.

1. The diameter A B of the top of a vessel, in the form of a parabolic conoid, measures 82, and the depth C m 96 inches ; what is the content in ale and wine gallons ?

*Inches.*

82 diameter of the top.

*Divisor 294.12) 822752 ( 1097.348 wine gallons.*

*By the Sliding Rule.*

As the circular gauge-point on D, is to half the depth on C; so is the diameter of the top of the vessel on D, to the content on C.

	On D.	On C.	On D.	On C.
As	$\left\{ \begin{array}{l} 18.95 \\ 17.15 \end{array} \right\}$	: 48	:: 82 :	$\left\{ \begin{array}{l} 898.91 \text{ ale gallons.} \\ 1097.35 \text{ wine gallons.} \end{array} \right\}$

2. The altitude of a vessel, in the form of a parabolic conoid, is 42 inches, and the diameter of the base 24 inches; what is the content in ale and wine gallons?

*Ans. 33.688 ale gallons, and 41.126 wine gallons.*

3. Required the content in malt bushels, of a vessel in the form of the segment of a paraboloid, the depth of which is 18 inches, and the diameter of the top 24 inches?

*Ans. 1.893 malt bushels.*

**REMARK.**

Vessels in the form of a hyperbolic conoid are seldom met with in Practice; if, however, they should occur, their contents may be found by the following Rule: To the square of the radius of the base add the square of the diameter taken in the middle between the base and the vertex; then this sum being multiplied by the depth, and the product thus obtained by .5236, will give the content in cubic inches. (See Nesbit's Mensuration, Prob. XIX., Part VII.)

**PROBLEM XVIII.**

*To find the content of a vessel in the form of the frustum of a parabolic conoid.*

**RULE.***By the Pen.*

Multiply the sum of the squares of the top and bottom diameters by the depth of the vessel; divide the product by 718.10, 588.24, and 5476; and the respective quo-

tients will be the content in ale and wine gallons, and malt bushels.

*Note 1.* The foregoing divisors are obtained by multiplying the circular divisors by two.

2. If the frustum of two equal paraboloids be joined together, at their greater ends, they will form a figure which, by Gaugers, is called a cask of the *third variety*.

✂ The cut on this page should have appeared on page 192; and that on page 192 should have been inserted on this page; the mistake, however, was not discovered until page 189 was printed.

#### EXAMPLES.

1. Required the content of the parabolic frustum *A B C D*, in ale and wine gallons, and malt bushels; the diameter *A B* of the bottom being 40 inches, the diameter *D C* of the top 30 inches, and the perpendicular depth *m n* 18 inches?

*The top diameter.*  
*Inches.*

30

30

900 square.

*The bottom diameter.*  
*Inches.*

40

40

1600 square.

900 square.

2500 sum.

18 depth.

20000

2500

*Divisor 718.1* 45000 (62.665 ale gallons.

Also,  $45000 \div 588.24 = 76.499$ , the content in wine gallons; and  $45000 \div 5476 = 8.217$ , the content in malt bushels.

*By the Sliding Rule.*

Multiply the difference of the two diameters by .55,

if that difference is less than 6 inches, but by .57, if it exceeds 6 inches; add the product to the less diameter, and the sum will be the mean diameter; then As the circular gauge-point on D, is to the depth on C, so is the mean diameter on D, to the content on C.

On A.	On B.	On A.	On B.
As 1	: 10	:: .57	: 5.7 the product.
Add .....			30.0 the less diameter.
			<u>35.7 the mean diameter.</u>

On D.	On C.	On D.	On C.
As { 18.95	: 18 ::	35.7 :	{ 63.8 ale gallons.
17.15			{ 78.0 wine gallons.
52.32			{ 8.4 malt bushels.

2. Here the contents found by the Rule exceed those found by the former, in consequence of the mean diameter being a little too small.

What is the content in ale and wine gallons, of a cask, in the form of the frustum of a paraboloid; the diameter of the greater end being 100 inches, that of the lesser end 50 inches, and the depth 56 inches?

*Ans.* 974.794 ale gallons, and 1189.990 wine gallons. The head diameter of a cask in the form of two frustums of a parabolic conoid is 21 inches, the diameter 28 inches, and the length 36 inches; what is the content in ale and wine gallons?

*Ans.* 61.412 ale gallons, and 74.969 wine gallons.

#### REMARK.

If a vessel in the form of the frustum of a hyperbolic paraboloid should be met with, its content may be found by the following Rule: To the sum of the squares of the greatest and least semi-diameters, add the square of the mean diameter; then this sum being multiplied by the length, and the product thence arising by .5236, will give the content in cubic inches. (See Nesbit's Mensuration, XX., Part VII.)

## PROBLEM XIX.

*To find the content of a circular vessel when its sides are a little curved.*

## RULE.

*By the Pen.*

To the sum of the squares of the top and bottom diameters, add four times the square of the middle diameter multiply this sum by the depth; divide the product by 2154.8, 1764.72, and 16428; and the respective quotients will be the content in ale and wine gallons, and malt bushels.

*Note 1.* The foregoing divisors are found by multiplying the circular divisors by six.

2. As vessels of this kind are seldom perfectly round, it is best to measure two diameters at right angles to each other; and take half their sum for a mean diameter.

3. The Rule given in this Problem is the same, in substance, as that given in Problem IX. See the Scholium in that Problem.

4. This Problem, and some of the following Problems, cannot be easily solved by the Sliding Rule.

## EXAMPLES.

1. The diameter A B, of a circular vessel, measures 68, the diameter C D 70, the diameter E F 68, and the depth is 58 inches; what is the content, in ale and wine gallons, and malt bushels?

*Divisor 2154.3)1635194(759.037 ale gallons.*

*Also,  $1635194 \div 1764.72 = 926.602$ , the content in wine gallons; and  $1635194 \div 16428 = 99.537$ , the content in malt bushels.*

2. The bottom diameter of a vessel is 84, the middle diameter 94, the top diameter 81.5, and the depth 52 inches; what is the content in ale and wine gallons?

*Ans. 1183.770 ale gallons, and 1445.100 wine gallons.*

3. The head diameter of a spheroidal cask is 80, the bung diameter 35, and the length 38 inches; what is the content of the cask, in ale and wine gallons?

*Ans. 118.181 ale gallons, and 144.272 wine gallons.*

*Note.* The content of this cask, found by the Rule given in Problem XIV., is the same as above.

## PROBLEM XX.

*To find the content of a circular vessel, when its sides are much curved, by taking five diameters at equal distances from each other.*

### RULE.

*By the Pen.*

Add into one sum, the squares of the top and bottom

diameters, twice the square of the middle diameter, and four times the sum of the squares of the diameters taken at one-fourth and at three-fourths of the depth; multiply this sum by the depth; divide the product by 4308.6, 3529.44, and 32856, and the respective quotients will be the content in ale and wine gallons, and malt bushels.

*Note 1.* The foregoing divisors are found by multiplying the circular divisors by twelve.

2. The preceding Rule is deduced from the method of equi-distances, described in Problem XX., Part IV.

3. The content of any vessel of an ordinary size may be found by this Problem; but when a vessel is very deep, its sides very much curved, and great accuracy is required, its content must be found by the next Problem.

#### EXAMPLES.

1. The diameter A B, of a circular vessel, measures 57; C D 72, E F 80, G H 76, K L 65; and the depth is 48 inches; what is the content in ale and wine gallons, and malt bushels?

Here  $57^2 + 65^2 = 3249 + 4225 = 7474$ , the sum of the squares of the top and bottom diameters;  $80^2 \times 2 = 6400 \times 2 = 12800$ , twice the square of the middle diameter; and  $76^2 + 72^2 \times 4 = 5776 + 5184 \times 4 = 10960 \times 4 = 43840$ , four times the sum of the squares of the diameters taken at one-fourth and at three-fourths of the depth; then,  $(7474 + 12800 + 43840) \times 48 = 64114 \times 48 = 3077472$ ; and  $3077472 \div 4308.6 = 714.262$ , the content in ale gallons;  $3077472 \div 3529.44 = 871.92$ , the content in wine gallons; and  $3077472 \div 32856 = 93.67$ , the content in malt bushels.

$4=871.948$ , the content in wine gallons; and  
 $\div 32856=93.665$ , the content in malt bushels.

: top diameter of a circular guile-tun measures  
 bottom diameter 46, the diameter taken at one-  
 the depth 58, that taken at three-fourths of the  
 the middle diameter 68, and the depth 60 in-  
 what is the content of the vessel in ale gallons?

*Ans. 565.572 ale gallons.*

: top diameter of a circular mash-tun measures  
 bottom diameter 86, the diameter taken at one-  
 the depth 95, that at three-fourths of the depth  
 middle diameter 104, and the depth 82 inches;  
 the content of the vessel in malt bushels?

*Ans. 276.787 malt bushels.*

### REMARKS.

Contents of Stills, Still-heads, Wash-Backs, Spirit-  
 and every other curved vessel used by Victuallers,  
 Brewers, Distillers, &c. &c. may be found either  
 or the following Problem.

Wash-Back or any other vessel be truly elliptical,  
 of the horizontal, parallel sections may be ob-  
 by Prob. XVI., Part IV.; but the areas of the  
 al sections of oval vessels which are not truly  
 must be found by the method of equi-distant  
 s described in Prob. XX., Part IV. (See Prob-  
 X., Part III., where a method is given to deter-  
 whether an oval figure be greater or less than a true

### PROBLEM XXI.

*the content of a circular vessel, when its sides  
 ry much curved, by taking a competent number  
 i-distant, parallel sections.*

#### RULE I.

*By the Pen:*

the areas of as many equi-distant, parallel sec-  
 U

tions as you think necessary, by multiplying the square of the mean diameter of each section by .7854.

Then to the sum of the areas of the two end sections add four times the sum of the areas of all the even sections, and twice the sum of the areas of all the odd sections, not including the sections at the ends; multiply the sum by the common distance of the sections; divide the product by three; and the quotient will be the content in cubic inches.

Divide the content thus found, by 282, 231, and 2150.42; and the respective quotients will be the content in ale and wine gallons, and malt bushels.

*Note 1.* Always make choice of an odd number of sections, in order that the number of parts into which the vessel is divided, may be equal. Seven or nine will, in general, be sufficient, except when the vessel is very deep, in which case it may be necessary to take eleven, thirteen, &c. as the case may require.

2. The perpendicular depth of the vessel must first be taken, in order to determine the common distance of the ordinates, which may be found by dividing the whole depth by the number of sections minus one.

3. Great care must be taken to obtain the diameters of the sections at equal perpendicular distances from each other; for if their distance be measured upon the side of the vessel, it is evident that the process will be incorrect. (See Problem III., Part VI., for the method of quartering circular vessels, taking cross diameters, &c. &c.)

4. The Rule given in this Problem is founded upon the method of equi-distant ordinates, described in Problem XX., Part IV. (See the Scholium to that Problem.)

## RULE II.

Find the area corresponding to each mean diameter, in the Table of Ale or the Table of Wine Areas, Part VII.; and place those areas in regular succession, opposite to their respective diameters.

Then to the sum of the two extreme areas, add four times the sum of all the even areas, and twice the sum of all the odd areas; multiply this sum by the common distance of the diameters; divide the product by 3; and the quotient will be the content in ale or wine gallons. (See Problem XIII., Part IV.)

## EXAMPLES.

What is the content in ale and wine gallons, of a vessel whose depth  $mn$ , is 120 inches; and the diameters of seven equi-distant, parallel sections as viz., the diameter of the bottom or first section  $AB$ , the second  $CD$  146, the third  $EF$  161, the fourth  $GH$  164, the fifth  $KL$  166, the sixth  $MN$  157, diameter,  $PR$ , of the top or seventh section 144

*By Rule I.*

$24^2 \times .7854 = 16876 \times .7854 = 12076.3104$ , the area of the first section;  $146^2 \times .7854 = 21816 \times .7854 = 17124.8864$ , the area of the second section;  $161^2 \times .7854 = 20358.3534$ , the area of the third section;  $164^2 \times .7854 = 26896 \times .7854 = 21124.1184$ , the area of the fourth section;  $166^2 \times .7854 = 27556 \times .7854 = 21625.8864$ , the area of the fifth section;  $157^2 \times .7854 = 19359.3246$ , the area of the sixth section;  $144^2 \times .7854 = 20736 \times .7854 = 16286.0544$ , the area of the seventh or last section.

$12076.3104 + 16286.0544 = 28362.3648$ , the sum of the two end sections;  $(17124.8864 + 20358.3534 + 21124.1184 + 19359.3246) \times 4 = 57225.0294 \times 4 =$

U 2

228900.1176, four times the sum of the areas of all the even sections; and  $(20358.3534 + 21642.4824) \times 2 = 42000.8358 \times 2 = 84001.6716$ , twice the sum of the areas of all the odd sections; also,  $\frac{120}{6} = 20$ , the common distance of the sections; hence,  $(28362.8648 + 228900.1176 + 84001.6716) \times 20 = 341264.154 \times 20 = 6825283.08$   

$$\frac{6825283.08}{3} = 2275094.36$$
, the content in cubic inches; consequently  $\frac{2275094.36}{282} = 8067.710$ , the content in ale gallons; and  $\frac{2275094.36}{231} = 9848.893$ , the content in wine gallons.

*By Rule II.*

Diameters.		Areas.
	Inches.	Ale Gallons.
First	124.....	42.8237
Second	146.....	59.3672
Third	161.....	72.1925
Fourth	164.....	74.9080
Fifth	166.....	76.7462
Sixth	157.....	68.6499
Seventh	144.....	57.7518

Then  $42.8237 + 57.7518 = 100.5755$ , the sum of the two extreme areas;  $(59.3672 + 74.9080 + 68.6499) \times 4 = 202.9251 \times 4 = 811.7004$ , four times the sum of all the even areas; and  $(72.1925 + 76.7462) \times 2 = 148.9387 \times 2 = 297.8774$ , twice the sum of all the odd areas; hence  $(100.5754 + 297.8774 + 811.7004) \times \frac{20}{3} = \frac{1201.1533 \times 20}{3} = \frac{24203.0660}{3} = 8067.6886$ , the content in ale gallons, the same as before.

<i>Diameters.</i>		<i>Areas.</i>
<i>Inches.</i>		<i>Wine gallons.</i>
<i>First</i>	124.....	52.2784
<i>Second</i>	146.....	72.4744
<i>Third</i>	161 .....	88.1814
<i>Fourth</i>	164.....	91.4464
<i>Fifth</i>	166.....	93.6904
<i>Sixth</i>	157.....	88.8066
<i>Seventh</i>	144.....	70.5024

52.2784 + 70.5024 = 122.7808, the sum of the two areas; (72.4744 + 91.4464 + 88.8066) × 4 = 14 × 4 = 990.9096, four times the sum of all the even and (88.1314 + 93.6904) × 2 = 181.8218 × 2 = 363.6436, twice the sum of all the odd areas; hence (122.7808 + 990.9096 + 363.6436) ×  $\frac{20}{3}$  =  $\frac{1477.3340 \times 20}{3}$  = 9848.8933, the content in wine gallons, the same as before.

The bottom or first diameter of a circular vessel is 108.4, the second 109.5, the third 120.8, the fourth 123.2, the fifth 124.5, the sixth 117.8, the seventh or top diameter 114.6, and the depth 114.6 inches; required the content in ale and wine gallons, by the second Rule.  
4340.13839 ale gallons, and 5298.37756 wine gallons.

The bottom or first diameter of a circular vessel is 108.4, the second 123.6, the third 130.8, the fourth 136.6, the fifth 136.2, the sixth 131.8, the seventh 124.5, the eighth 114.8, the ninth or last 96.8, the depth 18.3, and the common distance of the diameters 18.3; required the content in ale and wine gallons, and malt bushels, by the first Rule.  
6476.8996482 ale gallons, 7906.8645056 wine gallons, and 849.36231 malt bushels.

REMARK.

Sometimes the contents of vessels whose sides are frustums of cones, are found by dividing them into a number of similar frustums, and then finding the content of each, and adding them together.

equal or unequal parts, and calculating the content of each part by the Rule for the frustum of a cone. This method, however, is extremely troublesome; and if the vessel be not divided into a great number of parts, so that the altitude of each part may be small, it is also very incorrect. For example, if the vessel belonging to the first Question in the last Problem, be taken as the frustums of six cones, its content will be 8034.0292 ale gallons, and 9807.776 wine gallons, which is too little by 33.6594 gallons of ale, and 41.1173 gallons of wine; hence we perceive the excellency of the Rules given in the last three Problems, for finding the contents of vessels when their sides are curved, and the nature of the curves cannot be determined; that is, when we cannot determine whether a vessel is the frustum of a sphere, the frustum of a spheroid, the frustum of a parabolic spindle, the frustum of a paraboloid, or the frustum of a hyperboloid.

## PROBLEM XXII.

*To find the content of the ungula or hoof of a cylinder, or the quantity of liquor contained in a cylindrical vessel placed in an inclining position, so that the surface of the liquor intersects the sides of the vessel in an oblique direction.*

### RULE.

*By the Pen.*

Multiply the square of the diameter of the base by half the sum of the greatest and least depths of the liquor; divide the product by 359.05 and 294.12, and the respective quotients will be the content in ale and wine gallons.

*Note 1.* The greatest and least depths of the liquor must not be taken perpendicularly to the horizon, but close to the sides of the vessel.

*2.* If a cylindrical vessel be placed in such an inclining position that the liquor just covers the bottom, it is evident that the hoof will be

cylinder; consequently, the square of the diameter of the base is multiplied by half the greatest depth of the liquor, and the result divided by the proper divisors, in order to obtain the content in malt and wine gallons.

The divisor will be 2736, when the content is required in malt

EXAMPLES.

What is the content of the cylindrical hoof A B C D, in malt and wine gallons; the diameter A B of the base 38.2 inches, the greatest depth B C, of the liquor, 32.6 inches, and the least depth A D 18 inches?

For 38.2<sup>2</sup> = 1459.24, the square of the diameter of the base; and  $\frac{32.6 + 18}{2} = \frac{50.6}{2} = 25.3$ , half the sum of the greatest and least depths of the liquor; then  $1459.24 \times 25.3 = 36918.772$ ; and  $36918.772 \div 359.05 = 102.823$ , the content in malt gallons; also,  $36918.772 \div 294.12 = 125.522$ , the content in wine gallons.

The greatest depth of the liquor contained in a cylindrical vessel, placed in an inclining position, is 58.6 inches, and the least depth 18.2 inches; what is the content in wine gallons; the diameter of the base being 63.8 inches? *Ans. 722.690 wine gallons.*

What is the content of a cylindrical ungula, in malt and wine gallons; the diameter of its base being 63.8 inches, the

greatest depth 28.8 inches, and the least depth 25.2 inches?  
*Ans. 40.138 malt bushels.*

4. The diameter of a cylindrical vessel is 65 inches and it is placed in such a position that the liquor just covers the bottom; how many ale gallons does it contain, the greatest depth of the liquor being 25.8 inches?  
*Ans. 151.796 ale gallons.*

### PROBLEM XXIII.

*To find the content of a cylindrical ungula or hoof, when its base is less than a semi-circle.*

#### RULE.

*By the Pen.*

Find the area of the base of the ungula, by Problem XV., Part IV.; and multiply it by the difference between half the diameter of the vessel, and the versed sine of the ungula's base.

Subtract the product thus obtained from  $\frac{2}{3}$  of the cube of half the chord; multiply the remainder by the height of the ungula; divide the product by the versed sine of the base; and the quotient will be the content in cubic inches.

Divide this content by 282 and 231, and the respective quotients will be the content in ale and wine gallons.

*Note 1.* When the base of an ungula is less than a semi-circle,  $EF$  will denote the chord, and  $Bm$  the versed sine; consequently, the difference between half the diameter of the vessel and the versed sine of the ungula's base, will be denoted by  $B r - B m = m r$ .

2. When the base of an ungula is a semi-circle, the edge of the liquor will coincide with the diameter  $CD$ .

3. When the base of an ungula is greater than a semi-circle,  $GH$  will denote the chord, and  $Bn$  the versed sine; hence the difference between the

line of the base and half the diameter of the vessel, will be by  $B\pi - B\tau = \tau\pi$ . (See the two following Problems.)

EXAMPLES.

The diameter  $AB$  of a cylindrical vessel, is 65 inches, and it is placed in such a position that the chord of the ungula's base measures 56 inches, and its versed sine 16 inches; what is the content of the liquor, in gallons, the height  $BC$ , of the ungula being 64 inches.

By Rule II., Prob. XV., Part IV., we have  $16 \div 65 = .2461538$ , the tabular height, or quotient of the versed sine divided by the diameter. The Area Seg. corresponding to this quotient, is .150091; then  $.150091 \times 65^2 = .150091 \times 4225 = 634.134475$  square inches, the area of the base of the ungula.

$\frac{65}{2} - 16 = 32.5 - 16 = 16.5$ , the difference between half the diameter of the vessel and the versed sine of the base; and  $634.134475 \times 16.5 = 10463.2188375$ , the area of the base multiplied by the said difference.

,  $28^3 \times \frac{2}{3} = 21952 \times \frac{2}{3} = \frac{43904}{3} = 14634.666$ , two-thirds of the cube of half the chord; and  $14634.666 - 10463.2188375 = 4171.4478291$ ; then  $4171.4478291 \times 1.4478291 \times 4 = 16685.7913164$ , the content of the

ungula  $B C D$ , in cubic inches ; hence  $16685.791 \div 282 = 59.169$ , the content in ale gallons.

2. What is the content of the hoof of a cylinder, wine gallons ; the diameter of the vessel being 100 inches, the chord of the hoof's base 96 inches, the versed sine 36 inches, and the height of the hoof 108 inches ?

*Ans.* 495.142 wine gallon.

*Note.* The area of the ungula's base was found by the first Rule in Problem XV., Part IV.

### PROBLEM XXIV.

*To find the content of a cylindrical ungula, when its base is a semi-circle.*

#### RULE.

*By the Pen.*

Multiply the square of the diameter of the vessel by the height of the ungula ; divide the product by 6, and the quotient will be the content in cubic inches. Divide this content by 282 and 231, and the respective quotients will be the content in ale and wine gallons.

#### EXAMPLES.

1. The diameter  $A B$  of a cylindrical vessel is 65 inches, and it is placed in such a position that the liquor just covers one-half of its bottom ; what is the content of the ungula  $B C D$ , in ale gallons ; its height  $B C$ , being 64 inches ?

Here  $\frac{65 \times 65 \times 64}{6} = \frac{4225 \times 64}{6} = \frac{270400}{6} = 45066.666$ , the content in cubic inches; and  $\frac{45066.666}{282} = 159.810$ , the content in ale gallons.

2. A cylindrical vessel is placed in such a position that the liquor just covers one-half of its bottom, and rises up the side 126 inches; what is the content of the ungula, in wine gallons; the diameter of the vessel being 124 inches?  
*Ans.* 1397.818 wine gallons.

### PROBLEM XXV.

To find the content of a cylindrical ungula, when its base is greater than a semi-circle.

#### RULE.

*By the Pen.*

Find the area of the base of the ungula by Problem XV., Part IV.; and multiply it by the difference between the versed sine of the ungula's base, and half the diameter of the vessel.

To the product thus obtained, add  $\frac{1}{2}$  of the cube of half the chord of the ungula's base; multiply the sum by the height of the ungula; divide the product by the versed sine; and the quotient will be the content in cubic inches.

Divide this content by 282 and 231; and the respective quotients will be the content in ale and wine gallons.

#### EXAMPLES.

1. The diameter A B of a cylindrical vessel is 65 inches, and it is placed in such a position that the liquor leaves only 20 inches of the diameter of the bottom dry; what is the content of the ungula in ale gallons, the chord of its base being 60 inches, and its height B C, 64 inches?

By Rule I., Prob. XV., Part IV., we have  $60 \times 20 \times \frac{2}{3} = 1200$ ;  
 $\frac{2400}{3} = 800$ , two-thirds of the product of the chord and ver-  
 sed sine, and  $\frac{20^3}{60 \times 2} = \frac{800}{120} = 66.666$ , the cube of the height  
 divided by twice the chord; then  $800 + 66.666 = 866.666$   
 square inches, the area of the remaining segment.

By Note 1., Prob. XIII., Part IV., we have  $65 \times 65 \times$   
 $.7854 = 4225 \times .7854 = 3318.315$  square inches, the area of  
 the bottom of the vessel; then  $3318.315 - 866.666 =$   
 $2451.649$  square inches, the area of the base of the un-  
 gula.

Now,  $65 - 20 = 45$ , the versed sine of the ungula's base  
 and  $65 \div 2 = 32.5$ , half the diameter of the vessel; the  
 $45 - 32.5 = 12.5$ , the difference between the versed sine and  
 half the diameter; and  $2451.649 \times 12.5 = 30645.6125$  the  
 area of the ungula's base, multiplied by the said differ-  
 ence.

Again,  $30^3 \times \frac{2}{3} = 27000 \times \frac{2}{3} = \frac{54000}{3} = 18000$ , two-thirds  
 of the cube of half the chord; and  $30645.6125 +$   
 $18000 = 48645.6125$ ; then  $48645.6125 \times \frac{64}{45} = \frac{3113319.2}{45}$   
 $= 69184.871$ , the content of the ungula, in cubic inches; and  
 $\frac{69184.871}{282} = 245.336$ , the content in ale gallons.

The chord of the base of a cylindrical ungula measures 64 inches, the versed sine 64 inches, and the diameter of the vessel 80 inches; what is the content of the ungula in wine gallons; its height being 92 inches?

*Ans. 779.775 wine gallons.*

The area of the ungula's base was found by the second Rule of Problem XV., Part IV.

### REMARK.

When a vessel in the form of a cylinder, or part of a cylinder, is laid upon its side, so that the surface of the liquor is parallel to the axis, and comes in contact with the ends of the vessel, find the area of the circular segment of the end, by Problem XV., Part IV.; multiply it by the length of the vessel, and the product will be the content of the ungula in cubic inches.

If the vessel be laid in an inclining position, so that the surface of the liquor is oblique to the axis, making circular segments of the ends dissimilar figures, the content of the ungula may be found by Problem IX.

### PROBLEM XXVI.

To find the content of a pyramidal ungula, or the quantity of liquor contained in a vessel in the form of a frustum of a square or rectangular pyramid, when placed in such a position that the liquor just covers the bottom, or part of the bottom, and rises up one of the sides in an oblique direction, forming a figure that is called a cuneus or wedge.

### RULE.

*By the Pen.*

Multiply twice the length of the base of the ungula, by the length of the upper edge of the liquor; multiply the sum by the breadth of the base, and the product by the perpendicular height; and  $\frac{1}{6}$  of

X

the last product will be the content in cubic inches. Divide this content by 282, and 231; and the respective quotients will be the content in ale and wine gallons.

*Note 1.* All ungulas made by placing pyramidal or prismoidal vessels in a slanting position, so that the liquor covers all, or any part of their bottoms, are in the form of wedges; consequently, the foregoing Rule holds good for all ungulas so formed.

2. When the liquor covers only part of the bottom of the vessel, the base of the ungula will be that part of the bottom that is covered by the liquor.

#### EXAMPLES.

1. What is the content, in ale gallons, of the ungula  $A B C$ , of the square pyramidal vessel  $A B C D$ ; the side  $A B$  of the greater base being 80 inches, the side  $C D$  of the less base 52 inches, and the perpendicular height  $C m$  54 inches?

Here the dimensions of the ungula are the same as those of the pyramidal vessel; hence, by the Rule, we have  $80 \times 2 + 52 = 160 + 52 = 212$ , twice the length of the base added to the length of the upper edge of the liquor, then  $\frac{212 \times 80 \times 54}{6} = 16960 \times \frac{54}{6} = 16960 \times 9 = 152640$ , the content of the ungula in cubic inches; and  $\frac{152640}{282} = 541.276$  the content in ale gallons.

2. It is evident from the foregoing figure, that when the liquor in a pyramidal or prismoidal vessel just covers the whole of the bottom, and rises to the top of the vessel, in an oblique direction, it divides it into two ungulas in the form of wedges, one of which is occupied by the liquor, and the other is empty.

The length of the base  $AB$ , of a prismoidal vessel, 40 inches, the breadth of the base 27 inches, the length of the top 62 inches, the breadth of the top 35 inches, and the perpendicular height 28 inches; what is the content of the ungula  $EBF$ , in wine gallons; the length of its base being 30 inches, the breadth of its base 27 inches, the length of its edge 33 inches, and the perpendicular height  $Em$  22 inches?

*Ans. 39.857 wine gallons.*

It appears from the foregoing figure, that when the liquor in a pyramidal or prismoidal vessel, covers only part of the bottom, and rises to the top of the vessel in an oblique direction, it divides it into a wedge and a prismoid; thus  $EBF$  is a wedge, and  $A E F G$  a prismoid. If the liquor does not rise to the top of a pyramidal vessel, the empty part of the vessel will be composed of the prismoid  $A E F G$ , and the frustum  $G F C D$ . If the vessel be a prismoid, both figures will be prismoids.

Required the content in ale gallons, of the ungula  $EBF$  of a rectangular, pyramidal vessel; the length of the base 58 inches, the breadth of the base 15 inches, the length of the upper edge of the ungula 38 inches, and the perpendicular height of the ungula 22 inches?

*Ans. 172.021 ale gallons.*

X 2

## REMARKS.

1. When liquor intersects obliquely the opposite sides of a vessel in the form of the frustum of a square or rectangular pyramid, it disposes itself into a compound figure consisting of a wedge and the frustum of a pyramid: Thus in the annexed figure  $A B C D$ , if  $E F$  denote the surface of the liquor, then the ungula  $A B F E$ , is composed of the wedge  $E G F$ , and the frustum  $A B G E$ ;  $F n$  being the perpendicular height of the wedge;  $E G$  on the side of its base; and  $m n$  the perpendicular height of the frustum; hence the content of the whole ungula may be obtained by finding the contents of the two figures of which it is composed. It may also be observed, that the empty part of the vessel is composed of the wedge  $E F H$ , and the frustum  $H F C D$ .

2. When liquor intersects obliquely the opposite sides of a vessel in the form of a prismoid, it disposes itself into a compound figure consisting of a wedge and a prismoid: Thus in the annexed figure  $A B C D$ , if  $E F$  denote the surface of the liquor, then the ungula  $A B F E$ , is composed of the wedge  $E G F$ , and the prismoid  $A B G E$ ;  $B m$  being the perpendicular height of the prismoid,  $m n$  that of the wedge, and  $E G$  the length of its base.

3 The content of that part of a compound figure forming the frustum of a pyramid, may be found by Problem VI.; the content of that part forming a prismoid, by Problem IX.; and the content of that part forming a wedge, by the last Problem.

4. The content of the compound figure A B F E, may also be found by subtracting the content of the dry wedge E F H from the content of the frustum or prismoid A B F H. (See Problem XXIX.)

### PROBLEM XXVII.

*To find the content of a conical ungula, or the quantity of liquor contained in a vessel in the form of the frustum of a cone, when it stands upon its greater base, and in such a position that the liquor just covers the whole of its bottom.*

#### RULE.

*By the Pen.*

Multiply the product of the top and bottom diameters by the mean proportional between them; subtract the last product from the cube of the bottom diameter; divide the remainder by the difference of the diameters; multiply the quotient by the perpendicular height of the ungula, and the product thence arising by .0009283, and .001183; and the respective products will be the content in ale and wine gallons.

*Note.* When the liquor does not rise to the top of the vessel, the diameter at the upper extremity of the liquor, measured parallel to the top of the vessel, must be taken for the top diameter, in order to determine the content of the ungula.

## EXAMPLES.

1. What is the content of the ungula ABC, in ale gallons; the diameter AB being 60 inches, the diameter CD 40 inches, and the perpendicular height CM 35 inches?

Here  $\sqrt{60 \times 40} = \sqrt{2400} = 48.98979$ , the mean proportional between the diameters; and  $48.98979 \times 2400 = 117575.496$ , the product of the two diameters multiplied by the mean proportional between them.

Also,  $60^3 = 216000$ , the cube of the bottom diameter; and  $\frac{216000 - 117575.496}{60 - 40} = \frac{98424.504}{20} = 4921.2252$ ; then  $4921.2252 \times 35 \times .0009283 = 172242.882 \times .0009283 = 159.8930673606$ , ale gallons, the answer required.

2 Required the content of a conical ungula, in wine gallons; the bottom diameter being 82.6 inches, the top diameter 58.7 inches, and the perpendicular height 47.3 inches.

*Ans.* 506.756 wine gallons.

# PROBLEM XXVIII.

Find the content of a conical ungula, or the quantity of liquor contained in a vessel in the form of the frustum of a cone, when it stands upon its less base, and in such a position that the liquor just covers the whole of its bottom.

## RULE.

*By the Pen.*

Multiply the product of the two diameters by the square proportional between them; from the product thus obtained subtract the cube of the bottom diameter; divide the remainder by the difference of the diameters; multiply the quotient by the perpendicular height of the ungula, and the product thence arising by .0009283, and the result will be the content in ale and wine gallons.

## EXAMPLES.

What is the content of the ungula  $A B C$ , in wine gallons; the diameter  $A B$  being 30 inches, the diameter  $A C$  50 inches, and the perpendicular height  $A m$  40 inches.

found by subtracting the content of the dry hoof D E F from the content of the frustum A B E F.

2. What is the content, in wine gallons, of a composite figure consisting of the frustum of a cone and a conical ungula; the bottom diameter being 30 inches, the middle diameter 40 inches, the top diameter 50 inches; and the perpendicular height of the frustum, and also that of the ungula, 20 inches? *Ans. 141.516 wine gallons.*

#### REMARK.

If a vessel in the form of the frustum of a cone be laid upon its slant side, so that the surface of the liquor is either parallel or oblique to the axis, and comes in contact with both ends of the vessel, the content of the ungula thus formed, may be found by Problem IX Part V.

### PROBLEM XXX.

*To find the quantity of liquor contained in a vessel in the form of the frustum of a cone, when it is placed on its greater end, and in such a position that the liquor, covering only part of its bottom, forms an elliptic ungula.*

#### RULE.

##### *By the Pen.*

From the versed sine of the base of the ungula subtract the difference of the diameters of the vessel; divide the remainder by the less diameter; and find the *Area Seg.* answering to the quotient, in the Table of versed sines at the end of Part IV.

Multiply this *Area Seg.* by the cube of the less diameter; also multiply the product thus obtained by the quotient arising from dividing the versed sine of the base of the ungula by the difference between the said versed sine and the difference of the diameters; likewise

the last product by the square root of the said ; and reserve the product.

the versed sine of the base of the ungula by om diameter of the vessel ; find the *Area Seg.* g to the quotient ; and multiply it by the cube otom diameter.

the last product subtract the reserved product ; the difference by one-third of the perpendicular of the ungula ; divide the product by the differ- he diameters ; and the quotient will be the con- he ungula, in cubic inches.

this content by 282, and 231, and the respective will be the content in ale and wine gallons.

The ungula will always be elliptical when the versed sine is greater than the difference of the diameters of the and this will invariably be the case when the angle  $BED$  is ne angle  $BAC$ .

ic ungulas are more frequently met with than either para- perbolic ungulas ; as a parabolic ungula can be formed only surface of the liquor is parallel to the side  $AC$  : and a when the angle  $BED$  is greater than the angle  $BAC$ . in Problems XXXII. and XXXIII.)

### EXAMPLES.

What is the content of the elliptic ungula  $BDE$ , allons ; the diameter  $AB$  being 50 inches, the  $CD$  32 inches, the versed sine  $BE$  of the base s, and the perpendicular height  $D \approx 48$  inches ?

Here  $50 - 32 = 18$ , the difference of the diameters; and  $\frac{34 - 18}{32} = \frac{16}{32} = .5$ , the quotient obtained by subtracting the difference of the diameters from the versed sine of the base, and dividing the remainder by the less diameter. The Area Seg. answering to this quotient is .392699.

Now,  $32^3 = 32768$ , the cube of the less diameter; also,  $\frac{34}{34 - 18} = \frac{34}{16} = 2.125$ , the quotient arising from dividing the versed sine of the base by the difference between the said versed sine and the difference of the diameters; and  $\sqrt{2.125} = 1.457$ , the square root of the said quotient; then  $.392699 \times 32768 \times 2.125 \times 1.457 = 12867.960832 \times 2.125 \times 1.457 = 27344.416768 \times 1.457 = 39840.815230976$ , the reserved product.

Again,  $50^3 = 125000$ , the cube of the bottom diameter; and  $\frac{34}{50} = .68$ , the quotient of the versed sine of the base divided by the bottom diameter. The Area Seg. answering to this quotient is .568732; then  $.568732 \times 125000 = 71091.5$ , the product arising from multiplying the last Area Seg. by the cube of the bottom diameter.

Now,  $71091.5 - 39840.815 = 31250.685$ , the difference between the last product and the reserved product; also  $\frac{48}{3} = 16$ , one-third of the perpendicular height of the ungula; then  $31250.685 \times \frac{16}{18} = 31250.685 \times \frac{8}{9} = \frac{250005.48}{9} = 27778.386$ , the content of the ungula, in cubic inches; and  $\frac{27778.386}{282} = 98.504$ , the content in ale gallons.

2. The bottom diameter of a conical vessel is 60 inches, the top diameter 50 inches, the versed sine of the base of the elliptic ungula 40 inches, and its perpendicular height 54 inches; what is the content of the ungula in wine gallons?

Ans. 197.914 wine gallons.

## PROBLEM XXXI.

*Find the quantity of liquor contained in a vessel in form of the frustum of a cone, when it is placed on its less end, and in such a position that the liquor, filling only part of its bottom, forms an elliptical segment.*

## RULE.

*By the Pen.*

Take the difference of the diameters of the two ends of the vessel, add the versed sine of the base of the ungula; divide the sum by the greater diameter; then multiply the *Area Seg.* answering to this quotient by the square of the greater diameter, and call this product the *first number*.

Take the versed sine of the base to the difference of diameters; divide the versed sine by this sum; and the square root of the cube of the quotient call the *second number*.

Multiply the versed sine by the less diameter; multiply the *Area Seg.* answering to the quotient by the cube of the less diameter; and call this product the *third number*.

Multiply the perpendicular height of the ungula by three times the difference of the diameters; and call the quotient the *fourth number*.

Subtract the product of the *first* and *second* numbers from the product of the *third* number; multiply the difference by the *fourth* number; and the product will be the content of the ungula, in cubic inches.

Divide this content by 282 and 231, and the respective quotients will be the content in ale and wine gallons.

1. When a vessel in the form of the frustum of a cone, is placed on its less end, in such a position that the liquor covers part, or the whole of its bottom, the ungula will always be formed; that is, the surface of the liquor will form an ellipse when it covers the whole of the bottom; and an elliptical segment when it covers only part of the bottom.

2. For the Rule given in this Problem we are indebted to our much esteemed friend Mr. Joseph Lewthwaite, Teacher of the Mathematics at Halifax.

### EXAMPLES.

1. What is the content of the elliptic ungula B D *m* in wine gallons; the diameter A B being 32 inches, the diameter C D 50 inches, the versed sine B *m* of the base 30 inches, and the perpendicular height *m n* 48 inches?

Here  $\frac{50 - 32 + 30}{50} = \frac{18 + 30}{50} = \frac{48}{50} = .96$ . The Area Seg. answering to this quotient is .774861; and  $.774861 \times 50^3 = .774861 \times 125000 = 96857.625$ , the first number.

Again,  $\frac{30}{30 + 18} = \frac{30}{48} = .625$ ; and  $\sqrt{.625^3} = \sqrt{.244140625} = .4941$ , the second number.

Again,  $\frac{30}{32} = .9375$ . The Area Seg. answering to this quotient is .76496; and  $.76496 \times 32^3 = .76496 \times 32768 = 25066.20928$ , the third number.

Again,  $\frac{48}{18 \times 3} = \frac{48}{54} = .8888$ , the fourth number.

Now,  $96857.625 \times .4941 = 47857.3525125$ , the product of the first and second numbers; then  $(47857.3525125 - 25066.20928) \times .8888 = 22791.1432325 \times .8888 =$

68105046, the content of the ungula, in cubic inches, and  $\frac{20256.768}{231} = 87.691$ , the content in wine gallons.

What is the content of an elliptic ungula, in ale gallons; the diameter of the conical vessel being 110 inches, the top diameter 80 inches, the versed sine of the the ungula 36 inches, and its perpendicular height 45 inches?  
*Ans.* 145.579 ale gallons.

## PROBLEM XXXII.

To find the quantity of liquor contained in a vessel in the form of the frustum of a cone, when it is placed on its greater end, and in such a position that the liquor, covering only part of its bottom, forms a parabolic ungula.

### RULE

*By the Pen.*

Multiply the area of the base of the ungula by the diameter of the vessel; divide the product by the sum of the diameters; and reserve the quotient. Multiply the difference of the diameters by the lesser diameter; extract the square root of the product; and multiply the said root by  $\frac{1}{3}$  of the less diameter. Subtract the last product from the reserved quotient; multiply the remainder by  $\frac{1}{3}$  of the perpendicular height of the ungula; and the product will be the content in cubic inches.

Multiply this content by 282 and 231, and the respective products will be the content in ale and wine gallons.

The ungula will always be parabolical when the versed sine is equal to the difference of the diameters of the vessel; and will invariably be the case when the surface of the liquor is parallel to the upper side of the vessel, making the angle B E D equal to the angle B A C.

## EXAMPLES.

1. What is the content of the parabolic ungula B D E, in ale gallons; the diameter A B being 50 inches, the diameter C D 32 inches; and the perpendicular height E = 48 inches?

Here  $50 - 32 = 18 = B E$ , the versed sine of the base of the ungula; and  $\frac{18}{50} = .36$ . The Area Seg. answering to this quotient is .25455; then  $.25455 \times 50^3 = .25455 \times 2500 = 636.375$ , the area of the base of the ungula; and  $\frac{636.375 \times 50}{18} = \frac{31818.75}{18} = 1767.708$ , the reserved quotient.

$$\text{Again, } \sqrt{18 \times 32} \times 32 \times \frac{4}{3} = \sqrt{576} \times \frac{128}{3} = 24 \times \frac{128}{3} = \frac{3072}{3} = 1024.$$

Then  $(1767.708 - 1024) \times \frac{48}{3} = 743.708 \times 16 = 11899.328$ , the content of the ungula in cubic inches; and  $\frac{11899.328}{282} = 42.196$ , the content in ale gallons.

2. What is the content of a parabolic ungula, in wine gallons; the bottom diameter of the conical vessel being 100 inches, the top diameter 74 inches, and the perpendicular height of the ungula 34.5 inches?

Ans. 95.289 wine gallons.

## PROBLEM XXXIII.

*To find the quantity of liquor contained in a vessel in the form of the frustum of a cone, when it is placed upon its greater end, and in such a position that the liquor, covering only part of its bottom, forms a hyperbolic ungula.*

## RULE.

*By the Pen.*

Divide one-third of the perpendicular height of the ungula by the difference of the diameters of the vessel; and call the quotient the *first number*.

Multiply the area of the ungula's base by the greater diameter; and call the product the *second number*.

Multiply the less diameter by the versed sine of the ungula's base; divide the product by the axis of the hyperbolic section; multiply the quotient by the area of the hyperbolic section; and call the product the *third number*.

From the second number subtract the third; multiply the remainder by the first number; and the product will be the content of the ungula in cubic inches.

Divide this content by 282, and 231, and the respective quotients will be the content in ale and wine gallons.

*Note.* The axis of the hyperbola section is the distance between the upper extremity of the surface of the liquor and the middle of the chord of the ungula's base; and the area of the hyperbolic section is the area of the surface of the liquor. (See the definitions of the Conic Sections, Part V.)

*To find the area of the hyperbolic section.*

## RULE.

Multiply the transverse diameter by the absciss; to the product add  $\frac{1}{4}$  of the square of the absciss; and multiply the square root of the sum by 21.

Add the product last found to 4 times the square root of the product of the transverse and absciss; and divide the sum by 75.

Divide 4 times the product of the conjugate and absciss by the transverse; then this quotient being multiplied by the former will give the area, *nearly*.

*Note 1.* In finding the area of the hyperbolic section formed by the surface of the liquor, the absciss mentioned in the last Rule, is the axis of the section; and it may also be observed, that the chord of the ungula's base is the base of the section; and likewise in this case, its double ordinate. (See the definitions of the Conic Sections.)

2. Before we can find the area of the hyperbolic section of the liquor, we must determine the transverse and conjugate diameters.

*To find the transverse diameter of the hyperbolic section.*

#### RULE.

Multiply the less diameter of the vessel by the absciss of the hyperbolic section; and reserve the product. From the greater diameter of the vessel subtract the sum of the less diameter and the versed sine of the ungula's base. Divide the reserved product by the remainder; and the quotient will be the transverse diameter required.

*To find the conjugate diameter of the hyperbolic section.*

#### RULE.

From the greater diameter of the vessel subtract the sum of the less diameter and versed sine of the ungula's base. Divide the said versed sine by the remainder; and extract the square root of the quotient. Multiply this root by the less diameter; and the product will be the conjugate diameter of the section.

*Note.* The ungula will always be hyperbolic when the versed sine of the base is less than the difference of the diameters of the vessel; and this will invariably be the case when the angle  $BED$  is greater than the angle  $BAC$ .

#### EXAMPLES.

1. What is the content of the hyperbolic ungula

in wine gallons; the diameter  $AB$  being 72 inches, the diameter  $CD$  50 inches, the perpendicular  $DE$  54 inches, the slant height or axis  $DE$  of parabolic section formed by the surface of the liquor, and the versed sine  $BE$  of the ungula's base

CALCULATION.

find the transverse and conjugate diameters of the hyperbolic section.

$55 \times 50 = 2750$ , the reserved product; and  $72 - (50 = 72 - 70 = 2$ ; then  $\frac{2750}{2} = 1375$  inches, the transverse diameter.

in,  $\sqrt{20 \div 2} = \sqrt{10} = 3.1622$ ; and  $3.1622 \times 50 =$  inches, the conjugate diameter.

To find the area of the hyperbolic section.

$e \ 21 \ \sqrt{1375 \times 55 + 55^2 \times \frac{1}{4}} = 21 \sqrt{75625 + 8025 \times \frac{1}{4}}$   
 $\sqrt{75625 + 15125 \div 4} = 21 \sqrt{75625 + 2160.7142} = 21$   
 $85.7142 = 278.9 \times 21 = 5856.9$ .

in,  $(4 \sqrt{1375 \times 55 + 5856.9}) \div 75 = (4 \sqrt{75625 + 1100 + 5856.9}) \div 75 =$   
 $(4 \times 275 + 5856.9) \div 75 = (1100 + 5856.9) \div 75 = 6956.9 \div 75 = 92.758$ .

ly,  $\frac{158.11 \times 55 \times 4}{1375} \times 92.758 = \frac{34784.2}{1375} \times 92.758 =$

$25.297 \times 92.758 = 2346.499126$  the area of the section, in square inches.

*To find the area of the circular segment of the base.*

Here  $\frac{20}{72} = .277\bar{7}$ , the quotient of the versed sine divided by the diameter. The Area Seg. answering to .277, is .177330; and the Area Seg. answering to .278, is .178225; their difference is .000895; then  $.000895 \times \frac{1}{3} = .000696$ , which being added to .177330, gives .178026, the Area Seg. corresponding to  $.277\bar{7}$ ; hence,  $.178026 \times 72^2 = .178026 \times 5184 = 922.886784$ , the area of the base, in square inches.

*To find the content of the hyperbolic ungula B D E.*

Here  $\frac{54 \div 3}{72 - 50} = \frac{18}{22} = .8181$ , the first number.

Again,  $922.886784 \times 72 = 66447.848448$ , the second number.

Also,  $\frac{50 \times 20}{55} \times 2346.499126 = \frac{1000}{55} \times 2346.499126 = 18.1818 \times 2346.499126 = 42663.5778091068$ , the third number.

Lastly,  $66447.848448 - 42663.577809 \times .8181 = 23784.270639 \times .8181 = 19457.9118097659$ , the content in cubic inches; and  $\frac{19457.9118}{231} = 84.2333$ , the content in wine gallons.

2. What is the content of a hyperbolic ungula, in ale gallons; the greater diameter of the conical vessel being 96 inches, the less diameter 60 inches, the versed sine of the ungula's base 30 inches, the absciss 64 inches, and the perpendicular height 63 inches?

*Ans.* The transverse diameter of the hyperbolic section is 640, the conjugate 134.16, and the area 3631.120896. The area of the circular segment of the base is 1932.50304; and the content of the ungula 172.4975 ale gallons.

## GAUGING.

The length of a vessel, in the form of a parallelogram, is 81 inches, and its breadth 64 inches; required perpendicular depth; it being a mean proportional in the other two dimensions. *Ans. 72 inches.*

The area of a trapezium is 59536 square inches; find the side of a square of equal area.

*Ans. 244 inches.*

The area of the base of a circular vessel is 6482 inches; what is the diameter?

*Ans. 90.495 inches.*

The diameter of a cylindrical vessel is 78, and perpendicular depth 112 inches; required its diagonal.

*Ans. 136.484 inches.*

The diagonal of the base of a cubical vessel measures 15 inches; required the side.

*Ans. 81.817 inches.*

The diagonal of the base of a rectangular cooler measures 145 inches, and the length 116 inches; required breadth.

*Ans. 87 inches.*

The length of a cask is 45, the bung diameter 36, the head diameter 27 inches; required the diagonal.

*Ans. 38.71 inches.*

The bung diameter is 38.7, the head diameter 29.6, the diagonal 40.3 inches; required the length of the

*Ans. 42.78 inches.*

The content of a cylindrical vessel is 254 ale gallons; required the side of a cubical vessel that shall contain the same quantity of liquor. *Ans. 41.62 inches.*

10. The length of a water cistern in the form of parallelopipedon is 125, its breadth 86, and its depth 4 inches; required the dimensions of a similar vessel that shall contain 5 times as much.

*Ans. The length is 218.74, the breadth 147.05, and the depth 106.01 inches, nearly.*

11. The depth of a cylindrical vessel is 254, and its diameter 112 inches; what must be the dimensions of a similar vessel that shall contain only  $\frac{1}{4}$  of the quantity?

*Ans. The depth is 176.11, and the diameter 77.64 inches, nearly.*

12. The content of a vessel in the form of a parallelopipedon, is 121500 cubic inches; its length 75, its breadth 45, and its depth 36 inches; required the dimensions of a similar vessel that shall contain 562500 cubic inches.

*Ans. The length is 125, the breadth 75, and the depth 60 inches.*

13. The side of a square measures 62.8 inches; what is its area in ale gallons?

*Ans. 19.981 ale gallons.*

14. The length of a rectangle is 115.3 inches, and its breadth 86.4 inches; what is its area in wine gallons?

*Ans. 43.125 wine gallons.*

15. The base of a rhombus is 84.6 inches, and its perpendicular breadth 63.4 inches; required its area in malt bushels?

*Ans. 2.494 malt bushels.*

16. The base of a triangle measures 123.6 inches, and its perpendicular 85.7 inches; what is its area in ale gallons?

*Ans. 18.781 ale gallons.*

17. The three sides of a triangle measure 56, 68, and 79 inches respectively; what is the area in wine gallons?

*Ans. 8.076 wine gallons.*

18. The diagonal of a trapezium measures 138.6 inches, one of the perpendiculars 63.8 inches, and the other 56.4 inches; required the area in malt bushels.

*Ans. 3.873 malt bushels.*

19. The two parallel sides of a cooler, in the form of a trapezoid, measure 98 and 124 inches respectively, and the perpendicular distance between them 136 inches; what is the area of the vessel in ale gallons?

*Ans. 53.531 ale gallons.*

The first side of an irregular pentagon measures the second 104, the third 87, the fourth 92, and the fifth 112 inches; also, the diagonal from the first to the third angle 168, and that from the third to the fifth 114 inches; now, if the figure be an irregular floor of malt, how many bushels does it contain, if the depth of the floor be 6.4 inches?

*Ans. 49.376 malt bushels.*

The side of the base of an octagonal wine-vat measures 52.6 inches, and the perpendicular 63.7 inches; how many gallons of wine does the vessel contain, when the depth of the liquor is 84.3 inches?

*Ans. 4891.0017 wine gallons.*

The side of a regular nonagon measures 87.6 inches; what is its area in ale gallons?

*Ans. 168.21649 ale gallons.*

The diameter of a cylindrical porter-vat is 226.4 inches and its depth 258.8 inches; how many gallons of porter will it contain?

*Ans. 36945.5116 gallons.*

The radius of the sector of a circle is 52 inches, and the chord of the whole arc 86 inches; what is the area in wine gallons?

*Ans. 11.3763 wine gallons.*

The chord line of a cooler, in the form of the segment of a circle, measures 92 inches, and the versed sine 12 inches; how many gallons of ale does the vessel contain, when the depth of the liquor is 6.4 inches?

*Ans. 59.6608 ale gallons.*

The transverse diameter of an elliptical vessel measures 125.4 inches, and the conjugate 82.8 inches; what is the area in malt bushels?

*Ans. 3.792 malt bushels.*

The transverse diameter of an ellipse measures 100 inches, and the conjugate diameter 52.4 inches; required the area, in ale gallons, of a segment cut off by a line parallel to the transverse diameter; the height of the segment being 21.8 inches.

*Ans. 3.76808 ale gallons.*

The base of a parabola is 98.6 inches, and its height 75.4 inches; what is its area in wine gallons?

*Ans. 21.455 wine gallons.*

Required the area and content, in ale gallons, of a figure composed of a right-angled triangle, and a circular segment described upon the hypotenuse of the triangle; the versed sine of the segment being 25 inches; the base

and perpendicular of the triangle 60 and 80 inches respectively; and the depth of the liquor 9.4 inches.

*Ans. The area is 14.13, and the content 132.822 ale gallons.*

30. The base of a curvilinear figure measures 97.6 inches; the first perpendicular ordinate 49.5, the second 51.4, the third 52.2, the fourth 52.6, the fifth 53.2, the sixth 52.7, the seventh 52.3, the eighth 51.5, and the ninth 49.6 inches; required the area of the figure, in wine gallons, by the method of equi-distant ordinates.

*Ans. 21.958 wine gallons.*

31. The side of a cubical vessel measures 64.3 inches required its content in ale and wine gallons.

*Ans. The content is 942.722 ale, and 1150.855 wine gallons.*

32. The length of a cistern in the form of a parallel-pipedon, is 145 inches, its breadth 96 inches, and its depth 84 inches; how many gallons, ale measure, will it contain?

*Ans. 4146.382 ale gallons.*

33. The side of the base of a heptagonal, prismatic vessel measures 86.4 inches, and its perpendicular depth 73.6 inches; required its content in malt bushels.

*Ans. 927.972 malt bushels.*

34. The perpendicular depth of a cylindrical vessel is 76, and its diagonal 95 inches; required its content in ale gallons.

*Ans. 687.714 ale gallons.*

35. Each side of the top of a triangular, pyramidal vessel measures 53.8, and its perpendicular depth 62.4 inches; what is its content in wine gallons?

*Ans. 112.883 wine gallons.*

36. What is the content, in malt bushels, of a vessel in the form of the frustum of a pentagonal pyramid; each side of the greater end being 45.7 inches, each side of the less end 34.3 inches, and the perpendicular depth 68.4 inches?

*Ans. 88.1446 malt bushels.*

37. The slant side of a conical vessel measures 85, and the perpendicular depth 75 inches; what is the content in ale gallons?

*Ans. 445.62 ale gallons.*

38. The top diameter of a vessel, in the form of the frustum of a cone, measures 126.3, the bottom diameter 158.6, and perpendicular depth 132.7 inches; required the content in wine gallons.

*Ans. 9194.498 wine gallons.*

What is the content, in malt bushels, of a vessel form of a prismoid; the length of its bottom being and its breadth 42.6 inches; the length of its top and its breadth 54.8 inches; and the perpendicular 112.2 inches?

*Ans. 238.228 malt bushels.*

The perpendicular depth of a porter-vat, in the of the frustum of an elliptical cone, is 93.6 inches; transverse and conjugate diameters of the bottom are 99.2 and 75.6 inches; the transverse and conjugate diameters of the top, 134.4 and 100.8 inches; required the content in ale gallons.

*Ans. 2704.794 ale gallons.*

The inner diameter of a spherical vessel, measures inches; what is the content in wine gallons?

*Ans. 326.6026 wine gallons.*

The top diameter of a vessel in the form of the segment of a sphere is 35.6 inches, and its depth inches; what is the content in ale gallons?

*Ans. 35.208 ale gallons.*

The perpendicular depth of a vessel in the form of a greater segment of a sphere, is 32.7 inches; and the diameter of the base 53.8 inches; what is the content in wine gallons?

*Ans. 240.155 wine gallons.*

The top diameter of a vessel, in the form of the segment of a sphere, is 72, the bottom diameter 84, and the perpendicular depth 60 inches; required the content in malt bushels.

*Ans. 186.705 malt bushels.*

The transverse diameter of a vessel, in the form of a prolate spheroid, is 96, and the conjugate 82 inches; required the content in ale gallons?

*Ans. 1198.529 ale gallons.*

The diameter of the base of a vessel, in the form of a prolate semi-spheroid, is 40, and its perpendicular depth 28 inches; what is its content in wine gallons?

*Ans. 101.545 wine gallons.*

The middle diameter of a vessel, in the form of a middle frustum of a prolate spheroid, 48, the end diameter 40, and the length 50 inches; what is the content in wine gallons?

*Ans. 288.167 ale gallons.*

The bottom diameter of a vessel, in the form of a middle frustum of a prolate spheroid, is 72, the

top diameter 54, and the perpendicular depth 80 inches ; required the content in wine gallons.

*Ans. 1204.406 wine gallons.*

49. The length of a vessel in the form of a parabolic spindle, is 80 inches, and its middle diameter 50 inches ; required its content in ale gallons.

*Ans. 297.079 ale gallons.*

50. The top and bottom diameters of a vessel, in the form of the middle frustum of a parabolic spindle, measure 40 inches, the middle diameter 50 inches, and the perpendicular depth 54 inches ; required the content in wine gallons.

*Ans. 401.468 wine gallons.*

51. The diameter of the top of a vessel, in the form of a paraboloid, is 54 inches, and the perpendicular depth 64 inches ; required the content in ale gallons.

*Ans. 259.885 ale gallons.*

52. The diameter of the top of a vessel, in the form of a hyperboloid, is 60 inches, and the middle diameter, and the perpendicular depth, each 42 inches ; required the content in wine gallons.

*Ans. 253.6128 wine gallons.*

53. The bottom diameter of a vessel, in the form of the frustum of a paraboloid, is 72, the top diameter 48, and the perpendicular depth 30 inches ; required the content in ale gallons.

*Ans. 312.825 ale gallons.*

54. The bottom diameter of a vessel, in the form of the frustum of a hyperboloid, is 80, the middle diameter 68, the top diameter 48, and the perpendicular depth 96 inches ; required the content in wine gallons.

*Ans. 1479.68 wine gallons.*

55. The bottom diameter of a circular vessel, whose sides are curved, is 42, the middle diameter 47, the top diameter 45, and the perpendicular depth 48 inches ; required the content in ale gallons.

*Ans. 281.297 ale gallons.*

56. The bottom diameter of a circular vessel measures 69, the diameter at one-fourth of the depth, from the bottom, 87, the middle diameter 95, the diameter at three-fourths of the depth 90, the top diameter 78, and the depth 80 inches ; how many gallons of porter will the vessel contain ?

*Ans. 1700.246 gallons.*

57. What is the content of a circular vessel, in wine

whose perpendicular depth is 90 inches, and the diameters of seven equi-distant, parallel sections as viz. the diameter of the bottom or first section the second 97.5, the third 107.4, the fourth 109.3, the fifth 110.7, the sixth 104.6, and the diameter of the seventh section 96.2 inches?

*Ans. 3284.926 wine gallons.*

What is the content of a cylindrical ungula, in ale gallons; the diameter of its base being 50 inches, the depth 32 inches, and the least depth 23 inches?

*Ans. 191.477 ale gallons.*

What is the content of the hoof of a cylinder, in ale gallons; the diameter of the vessel being 85 inches, the versed sine of the hoof's base 36 inches, and the depth of the hoof 60 inches?

*Ans. 248.788 wine gallons.*

A cylindrical vessel is placed in such a position that liquor just covers one-half of its bottom, and the depth of the liquor on the side 50 inches; what is the content of the liquor in ale gallons; the diameter of the vessel being 60 inches?

*Ans. 106.382 ale gallons.*

The chord of the base of a cylindrical ungula, is 60 inches, the versed sine 36 inches, and the depth of the ungula 50 inches; what is its content in ale gallons?

*Ans. 167.580 wine gallons.*

The length of a cylindrical vessel is 60 inches, its diameter 50 inches, and the depth of the liquor, when the vessel is laid upon a horizontal plane, 40 inches; how many ale gallons does it contain?

*Ans. 358.284 ale gallons.*

The length of a cylindrical vessel is 60 inches, its diameter 50 inches; and the depth of the liquor, at one end, when the vessel is laid upon an inclined plane, is 40 inches, and at the other 25 inches; how many wine gallons does the vessel contain?

*Ans. 349.344 wine gallons.*

What is the content, in ale gallons, of the ungula triangular, pyramidal vessel; the length of the vessel being 87 inches, the breadth of the base 10 inches, the length of the upper edge of the liquor 15 inches, and the perpendicular height 63 inches?

*Ans. 584.872 ale gallons.*

65. The bottom diameter of a conical vessel is 60 inches, the top diameter 50 inches, and the perpendicular depth 40 inches. Now, if this vessel be placed in such a position that the liquor just covers its bottom, and rises up one side to the perpendicular height of 30 inches; required the content of the ungula, in wine gallons.

*Ans. 177.7541 wine gallons.*

66. The top diameter of a conical vessel is 60 inches, the bottom diameter 50 inches, and the perpendicular depth 40 inches. Now, if this vessel be placed in such a position that the liquor just covers the bottom, and rises up one side to the perpendicular height of 20 inches; how many ale gallons must be poured in, so that by changing the position of the vessel, the liquor may still just cover the bottom and rise to the top of the vessel?

*Ans. 74.63532 ale gallons.*

67. The bottom diameter of a conical vessel is 70 inches, the top diameter 60 inches, and the perpendicular depth 50 inches. Now, if this vessel be placed in such a position that the liquor just covers the bottom, and rises to the top of one side; how many ale gallons will fill the vessel, if it be placed with its base upon a horizontal plane?

*Ans. 260.8031 ale gallons.*

68. The bottom diameter of a conical vessel is 70 inches, the top diameter 75 inches, the versed sine of the base of the elliptic ungula 60 inches, and its perpendicular height 81 inches; what is the content of the ungula in ale gallons?

*Ans. 550.086 ale gallons.*

69. What is the content of an elliptic ungula, in ale gallons; the top diameter of the conical vessel being 55 inches, the bottom diameter 40 inches, the versed sine of the base of the ungula 18 inches, and its perpendicular height 21 inches?

*Ans. 18.192 ale gallons.*

70. What is the content of a parabolic ungula, in wine gallons; the bottom diameter of the conical vessel being 50 inches, the top diameter 37 inches, and the perpendicular height of the ungula 17.4 inches?

*Ans. 12.0102 wine gallons.*

71. The head diameter of a cask is 26, the bung diameter 32, and the length 45 inches; required the con-

ale and wine gallons ; admitting it to be a cask of variety.

*The content is 113.800 ale gallons, and 138.92% llons.*

The head diameter of a cask is 26, the bung diameter 2, and the length 45 inches ; required the content and wine gallons ; admitting it to be a cask of the variety.

*The content is 113.198 ale gallons, and 138.187 llons.*

The head diameter of a cask is 26, the bung diameter 2, and the length 45 inches ; required the content and wine gallons ; admitting it to be a cask of the variety.

*The content is 106.530 ale gallons, and 130.048 llons.*

The head diameter of a cask is 26, the bung diameter 2, and the length 45 inches ; required the content and wine gallons ; admitting it to be a cask of the variety.

*The content is 105.779 ale gallons, and 129.130 llons.*

The area of an equilateral triangle is 45 ale gallons ; required its side.

*Ans. 171.190 inches.*

The side of a vessel in the form of a triangular prism is 50 inches, and its depth 40 inches ; what is the difference, in ale gallons, between its content, and that of a cylindrical vessel that will just contain the prismatic

*Ans. 217.787 ale gallons.*

The length of a cooler is 80 inches, and its breadth 12 inches. Now if it be cut by a plane parallel to the side ; required the dimensions of the two vessels formed, when the area of the greater vessel is 12 ale gallons.

*The length of each vessel is 60 inches, the length of the greater 56.4 inches, and that of the less 23.6 inches.*

The length of a rectangular cistern is 86 inches, the breadth 64 inches, and its depth 48 inches. Now, if it be cut by a plane parallel to the shorter side ; required

the dimensions of the two cisterns thus formed, when the content of the less is 380 ale gallons.

*Ans. The length of each cistern is 64 inches, the breadth of the greater 51.118 inches, and that of the less 34.882 inches.*

79. The sides of a triangular cooler are 60, 70, and 80 inches, respectively. Now, if it be cut by a plane parallel to the longest side; required the dimensions of the remaining triangle, when the area of the portion parted off is three ale gallons.

*Ans. The three sides of the remaining triangle are 45.849, 58.490, and 61.132 inches, respectively.*

80. The sides of a triangular cooler are 60, 70, and 80 inches, respectively. Now, if it be cut by a plane passing from the opposite angle to the middle of the longest side; required the areas, in ale gallons, of the two vessels thus formed.

*Ans. The area of each vessel is 3.605 ale gallons.*

81. If the length of a cistern be 94, and its breadth 72 inches; what must be its depth, in order that it may contain 16 quarters of barley?

*Ans. 40.669 inches.*

82. The perpendicular depth of a cistern is 42, its breadth 108, and the diagonal of its bottom 180 inches; how many bushels of barley can be steeped in this cistern at one time, allowing  $\frac{1}{3}$  of the whole content for the swell of the grain?

*Ans. 242.997 bushels.*

83. The content of a cylindrical vessel is 9743 ale gallons, and the diameter of its base 147 inches; required its perpendicular depth.

*Ans. 161.888 inches.*

84. The diagonal of the base of a cubical vessel, is 72 inches; required the content in wine gallons.

*Ans. 571.268 wine gallons.*

85. The diameter of the legal Winchester bushel is  $18\frac{1}{2}$  inches, and its depth 8 inches; what is the diameter of that bushel whose depth is 9 inches?

*Ans. 17.441 inches.*

86. The bottom diameter of a vessel, in the form of the frustum of a cone, is 150 inches, the top diameter 86 inches, and the slant height 68 inches; what is the content in ale gallons?

*Ans. 2383.846 ale gallons.*

87. The slant height of a cistern in the form of the frustum of a square pyramid, is 85 inches, the perpendi-

eight 75, and the side of the base 195 inches; the content in malt bushels?

*Ans. 513.883 malt bushels.*

The content of a vessel in the form of a pentagon, is 8834 wine gallons, and the side of its base 6 inches; required its perpendicular depth.

*Ans. 94.005 inches.*

A reservoir measures 182 inches in length, 112 in breadth, and 74 in depth; how long will a person be in drawing water, by means of a pump; supposing he makes 16 strokes in a minute, and lifts 3 pints of water in each stroke?

*Ans. 9 hours, 8.614 minutes.*

The bottom diameter of a vessel, in the form of a frustum of a cone, is 86 inches, the top diameter 62 inches, and the perpendicular depth 58 inches; how many ale gallons are contained in the vessel, when the depth of the liquor is 40 inches?

*Ans. 615.401 ale gallons.*

The perpendicular depth of a vessel, in the form of a frustum of a square pyramid, is 65 inches, the side of the top 68 inches, and the side of the bottom 94 inches; how many wine gallons does the vessel contain, when the depth of the liquor is 45 inches?

*Ans. 1412.725 wine gallons.*

The perpendicular depth of a vessel, in the form of a frustum of an elliptical cone, is 65 inches; the transverse and conjugate diameters of the bottom measure 86 inches; the transverse and conjugate diameters of the top, 62 and 42 inches; how many ale gallons does the vessel contain, when the depth of the liquor is 42 inches?

*Ans. 485.1191 ale gallons.*

The perpendicular altitude of a conical vessel, is 60 inches, and the diameter of its base 64 inches. Now, the vessel be cut by a horizontal plane; required the ratio of the two vessels thus formed, in ale gallons, and the content of the frustum is to that of the segment as two to one.

*The content of the frustum is 220.552, and the content of the segment 110.276 ale gallons.*

The side of the base of a vessel, in the form of a frustum of a square pyramid, is 60 inches, the side of the top 40 inches, and the perpendicular depth 84 in-

ches. Now, if this vessel be cut by a plane parallel to the base; required the contents of the two vessels thus formed, in wine gallons, when the content of the greater is to that of the less, as five to four.

*Ans. The content of the greater vessel is 511.784, and the content of the less 409.4272 wine gallons.*

95. The diameter of the base of a conical vessel, is 60 inches, and its perpendicular altitude 72 inches. Now, if this vessel be cut by a plane parallel to the base; required the dimensions of the two vessels thus formed, when their contents are equal.

*Ans. The diameter of the section made by the cutting plane is 47.622 inches, the altitude of the segment 57.146 inches, and that of the frustum 14.854 inches.*

96. The side of the base of a vessel in the form of the frustum of a square pyramid, is 60 inches, the side of the top 40 inches, and the perpendicular height 50 inches. Now, if this vessel be cut by a plane parallel to the base; required the dimensions of the two vessels thus formed, when their contents are equal.

*Ans. The side of the section made by the cutting plane, is 51.924 inches, the altitude of one of the vessels 29.812 inches, and that of the other 20.188 inches.*

97. The internal diameter of a spherical vessel is 74 inches; and if it be cut by a horizontal plane, which makes the depth of the less segment 25 inches; required the contents, in ale gallons, of the two vessels thus formed.

*Ans. The content of the greater segment is 552.794, and that of the less 199.599 ale gallons.*

98. The diameter of the base of a vessel, in the form of a prolate semi-spheroid, is 50, and its perpendicular altitude 60 inches. Now, if this vessel be cut by a horizontal plane, at the distance of 30 inches from the base; required the contents, in wine gallons, of the two vessels thus formed.

*Ans. The content of the frustum is 233.748, and the content of the segment 106.249 wine gallons.*

99. The diameter of the base of a vessel, in the form of a paraboloid, is 50, and its perpendicular altitude 60 inches. Now, if this vessel be cut by a horizontal plane, at the distance of 30 inches from the base; required the

, in wine gallons, of the two vessels thus

*The content of the frustum is 191.248, and the cone segment 63.748 wine gallons.*

At Königstein, near Dresden, in Germany, is a cask whose head diameter is 25 feet or 300 inches, bung diameter 26 feet or 312 inches, and perpendicular altitude 336 inches; how many gallons of wine will it admit, admitting it to be of the third variety?

*The content of this enormous cask, is 107010 wine gallons, which exceeds the content of the cask at Heidelberg, 4½ gallons. (See Example 5, Prob. IV., Part V.)*

The Königstein cask was begun in the year 1722, and finished, under the direction of General Kyaw; and is considered the largest cask in the world. It consists of 157 staves, each 8 inches thickness; and one of its heads is composed of 26, and the other of 8 boards. The top or upper head of this enormous cask is covered with lead, and affords sufficient room for twenty persons to regale themselves.

#### REMARK.

Having given copious directions for finding the Areas and Contents of all Vessels that can possibly be met with in practice, and illustrated those directions by numerous Examples, we come now to describe the methods of *gauging* the Utensils of Victuallers, Common Brewers, Distillers, Maltsters, Starch-makers, Soap-makers, Glass-makers, &c. &c. as practised in the Excise.

## PART VI.

*The Method of Gauging and Fixing Victuallers' Utensils; of Gauging and Inching Common Brewers' Utensils; and of Gauging and Ullaging Casks. Also, the Method of Gauging and Fixing Maltsters' Utensils; and of Gauging and Inching a Still, and a Distiller's Wash-Back. Likewise, the Method of Gauging and Fixing the Utensils of Starch Makers, Soap Makers, and Glass Makers, as practised in the EXCISE.*

---

### SECTION I.

THE METHOD OF GAUGING AND FIXING VICTUALLERS' UTENSILS, AS PRACTISED IN THE EXCISE.

---

#### PROBLEM I.

*To gauge and fix a mash-tun, in the form of the frustum of a cone.*

*To take the dimensions.*

With the Dimension Cane, or any other convenient instrument, take the perpendicular depth of the vessel.

Also, with the Diameter Rule, take two cross diameters of the top, at right-angles to each other; and likewise two cross diameters of the bottom. Add these diameters together; divide the sum by 4, and take the quotient for a mean diameter.

*Note 1.* A mean diameter may also be found by taking two cross

at one-half of the perpendicular depth, and dividing their sum

als in the form of the frustum of a cone, are seldom per-  
lar; hence the propriety of taking cross diameters, in order  
ne the mean diameter.

Diameter Rule will take any dimension from 24 to 47 in-  
either of the diameters exceed 47 inches, the Dimension  
be used, which will take any diameter from 36 to 120

*To find the area and content.*

### RULE.

the square of the mean diameter by 289, and  
ent will be the area in mash-tun gallons.

ly this area by the depth of the vessel, or by the  
the grains, generally called *goods*; and the  
ict will be the content in mash-tun gallons.

If the area be multiplied by the depth of the vessel, the  
ill be the whole content of the vessel; but if multiplied  
th of the *goods*, it is evident the product will be the content  
s, in mash-tun gallons.

-tuns are generally in the form of the frustum of a cone;  
ometimes placed on their less, and sometimes on their greater  
whatever position, however, a victualler's round mash-tun  
t is always gauged according to the foregoing directions.  
gh this method is not mathematically correct, yet it is con-  
rate enough for victuallers' mash-tuns; because they are  
nall vessels, and no duty arises from mash-tun gauges.

h-tuns of Common Brewers are gauged and fixed in a very  
anner. (See the next Section.)

ie divisors and gauge-points used in this and the follow-  
ns, may be found in the Table of Factors, Part IV.

### EXAMPLES.

the following figure A B C D, represent a mash-  
the form of the frustum of a cone, whose per-  
r depth is 40.5 inches, the cross diameters of the  
and 64.4 inches, and the cross diameters of the  
5.2 and 45.6 inches; required its area and con-  
ash-tun gallons.

## BY THE SLIDING RULE.

*To find the area.*

The circular gauge-point on D, is to unity on C; so the mean diameter on D, to the area on C. Or, as the circular divisor on A, is to the mean diameter on B; so the mean diameter on A, to the area on B.

On D.    On C.    On D.    On C.  
As 17.07 : 1 :: 55.1 : 10.51 area.

Or,

On A.    On B.    On A.    On B.  
As 289 : 55.1 :: 55.1 : 10.51 area.

*To find the content.*

The circular gauge-point on D, is to the depth on C; so is the mean diameter on D, to the content on C. Unity on A, is to the area on B; so is the depth on B, to the content on B.

On D.    On C.    On D.    On C.  
7.07 : 40.5 :: 55.1 : 425.66 content.

Or,

On A.    On B.    On A.    On B.  
As 1 : 10.51 :: 40.5 : 425.66 content.

1. The dimensions and area thus found are transferred to the end of the dimension book, at the end of this section; and the process is called *gauging* and *fixing* the mash-tun.

In practice, the area must always be found to three places of decimals; and in transferring to the dimension book, if the third place be above, the second is called one more; but if the third place be below, it is rejected.

It is customary in the practice of gauging to take the depth of the mash-tun to the nearest whole inch, and to enter the content in gallons, if the first decimal, in the content, be .5 or above, it is called one more gallon, but if it be under .5, it is rejected; consequently the content would be called 426 gallons.

The perpendicular depth of a circular mash-tun, in the form of the frustum of a cone, is 50.5 inches, the diameters taken at one-half of the perpendicular depth, are 73.4 and 72.6 inches; required the area and content of the vessel, in mash-tun gallons.

The area is 18.439, and the content 981.22 mash-tun gallons.

A a

*Note.* In the real practice of gauging, the content is always found from the depth of the goods ; but in the foregoing and following examples, we have found the whole content of the vessel. The process, however, in both cases is the same.

#### REMARKS.

1. By the Rule for the frustum of a cone, Prob. VIII., Part V., we find the content of the mash-tun in the first example, to be 429.82 gallons ; hence the content found by this Problem is too little by 4 gallons.

2. It frequently happens that the surface of the grains is several inches below the top of the tun, when it is gauged by the Officer. Now, when this is the case, the mean area multiplied by the depth of the grains will evidently give the content too much when the vessel stands upon its less end, and too little when it stands upon its greater end : for example, suppose the depth of the grains in the foregoing mash-tun, question the first, to be only 32 inches ; then we have  $10.51 \times 32 = 336$  gallons, the content found by using the mean area obtained when the vessel is supposed to be full. But this mean area is evidently too great ; for the diameter at the top of the grains, found by Prob. XIV. is only 60.8 inches ; hence we have  $(60.8 + 45.4) \div 2 = 106.2 \div 2 = 53.1$ , the mean diameter ; and  $(53.1 \times 53.1) \div 289 = 2819.61 \div 289 = 9.76$  gallons, the mean area ; then  $9.76 \times 32 = 312$ , the content in gallons ; consequently, the former content is too much by 24 gallons.

3. Again, let the same vessel be inverted, so as to stand upon its greater base, and let the depth of the grains be 32 inches, as before ; then it is evident that the content will still be 336 gallons, by using the mean area obtained when the vessel is supposed to be full. But this mean area is evidently too little ; for the diameter at the top of the grains, found by Prob. XIV., is 49.4 inches ; hence we have  $(64.8 + 49.4) \div 2 = 114.2 \div 2 = 57.1$ , the mean diameter ; and  $(57.1 \times 57.1) \div 289 = 3260.41 \div 289 = 11.28$  gallons, the mean area ; then  $11.28 \times 32 = 361$ , the content in gallons ; consequently, the former content is too little by 25 gallons.

4. Notwithstanding the method of gauging and fixing victuallers' mash-tuns, as described in the foregoing Problem, has been generally adopted in practice, yet it is necessary to observe that by a late Act of the 1st and 2nd Geo. IV.

2, the greatest accuracy is required in gauging computing the contents of mash-tuns.

, as it frequently happens that victuallers use more : one brewing than at another, it is evident, as observed, that a mean fixed area multiplied by the of the goods cannot always give the true content h-tun gallons ; these irregularities, however, may y obviated, by taking diameters in the middle of en inches, and fixing the mash-tun in the same as a guile-tun. This method becomes absolutely y, when the mash-tun has curved sides.

## PROBLEM II.

*ge and fix a mash-tun in the form of the frustum of a square pyramid.*

*To take the dimensions.*

any convenient instrument, take the perpendicular h of the tun.

measure each side of the top ; divide the sum of mensions by 4 ; and the quotient will be a mean on. Find a mean dimension of the bottom in the inner ; then half the sum of these two mean di- s will be the mean dimension of the middle.

The mean dimension of the middle may also be found by ; the sides of the vessel at half of the perpendicular depth. els that assume the form of the frustum of a square pyra- eldom perfectly square ; hence the necessity of measuring all n order to determine the mean dimensions.

*To find the area and content.*

## RULE.

ply the mean dimension of the middle of the r itself ; divide the product by 227, and the quo- l be the area in mash-tun gallons.

ply this area by the perpendicular depth ; and uct will be the content in mash-tun gallons.

## EXAMPLES.

the following figure A B C D E F G, represent tun, in the form of the frustum of a square  
A a 2

and bottom for a mean length, and half the sum of the breadths for a mean breadth ; then multiply the mean length by the mean breadth, divide the product by 227, and the quotient will be the mean area, in mash-tun gallons.

2. If a mash-tun be a parallelopipedon, the area of its base may be found by Prob. II. ; if it be a prism, by Prob. IX. ; and if it be a cylinder, by Prob. XIII., Part IV.

### PROBLEM III.

*To gauge and fix a copper with a falling-crown.*

*To take the dimensions.*

The most eligible method of taking the dimensions of circular vessels, is to quarter them, in order to obtain cross diameters as correctly as possible.

First, take the diameter of the top of the vessel, which multiply by .707, or .7 ; and the product will be the side of the inscribed square. (See Rule III., Prob. XII., Part IV.)

Apply the side of the square thus found, four times to the top of the copper, by your dimension cane, or tape ; and mark, with chalk, each angle of the inscribed square ; and thus will the top of the vessel be quartered.

With a steady hand, draw a chalk line, from each quartering point, down the inside of the vessel, to the bottom ; taking care that these lines be equally distant from each other, not only at the bottom of the vessel, but also at every horizontal section ; otherwise the vessel will not be truly quartered in every part.

Place your dimension cane, or other instrument, in a perpendicular direction, with its end resting upon the bottom of the copper, half-way between the centre of the crown and the side ; at the same time laying a rod or holding a cord diametrically across the top, so as to come in contact with the dimension cane ; and thus you will have the perpendicular depth of the copper, upon the dimension cane, where it intersects the rod or cord at the top.

Now, in order to take cross diameters in the middle of

ten inches, mark the dimension cane with chalk, 5, 25, 35 inches, &c. ; and place that instrument in the manner in which it stood in taking the depth ; ring a rod horizontally in contact with the cane, at 5 inches from the bottom, so that the rod and cane may form right angles ; and let the end of the rod, at the same time, touch one of the quartering lines ; and there mark with chalk, on the inside of the vessel ; and you will have one point at which a diameter must be

taken the same at 15, at 25 inches, &c. from the bottom ; you will obtain all the points in one of the quartering lines, at which diameters must be taken.

These points may then be transferred to the other three quartering lines, by a pair of compasses or a dipping-piece ; and then you may proceed to take cross diameters as directed ; always beginning at the bottom.

1. The sum of each pair of cross diameters must be divided by 2 to obtain mean diameters.

When the sides of a copper or other vessel, are much curved, and great accuracy is required, cross diameters must be taken in the middle of every 6 or 8 inches ; but in practice, 10 inches is the most convenient number, for in multiplying the area, corresponding to each diameter, by 10, it is only necessary to remove the decimal point one place towards the right-hand.

*To find the area and content.*

### RULE I.

Find the area corresponding to each mean diameter, in the Table of *Ale Areas*, Part VII. ; then multiply each by its respective depth ; and the sum of the products will be the whole content required. (See Prob. XIII., V.)

### RULE II.

Take the square of the first mean diameter by 5 ; and the quotient will be the area of the first circular section, in ale gallons.

Find the area of each horizontal section in the same manner ; then multiply each area by its respective per-

pendicular depth; and the sum of the products will be the whole content of the copper.

*Note 1.* If it be required to find the quantity of liquor contained in a copper, at any assigned depth, suppose 24.8 inches, when the mean diameters are taken in the middle of every 10 inches, remove the decimal points, in the first and second areas, one place towards the right; and multiply the third area by 4.8, and the sum of the three products will be the content of the copper, at 24.8 inches of the perpendicular depth.

2. It is scarcely necessary to observe that the depth of the liquor must always be taken half-way between the side of the vessel and the centre of the crown, as before directed.

#### EXAMPLES.

1. Let the following figure A B C D represent a copper with a falling crown; it is required to gauge and fix it, according to the method practised in the Excise.

#### *To take the dimensions.*

First, take the diameter C D of the top of the copper, which you will find to be 49 inches; then,  $49 \times .7 = 34.3$  inches, the side of the inscribed square.

With this number quarter the top of the copper, as before directed; and draw four chalk lines from the quartering points to the bottom.

Measure the diameter A B, which you will find to be 40 inches; and  $40 \div 4 = 10$ . Set off 10 inches from A to E; and E will be the point that is half-way between the centre of the crown and the side of the vessel; hence we

nd the perpendicular depth  $E r$ , to be 40 in-

g made marks, with chalk, upon the dimension  
 , 15, 25, and 35 inches from the bottom, place  
 rument perpendicularly at  $E$ ; then bring a rod  
 with it at  $m$ , 5 inches from the bottom, forming  
 ontal line  $ma$ , and mark the side of the copper

same at  $n$ ,  $o$ , and  $x$ ; namely, at 15, 25, and 35  
 om the bottom; and you will obtain the points  
 d.

transfer these points to the other three quarter-  
 ; take the necessary cross diameters; and enter  
 mensions in your Note Book.

the depth of the copper is exactly 40 inches, the upper  
 d, falls at 5 inches from the top; but if the depth had been  
 then the upper diameter would have fallen at 4 inches from  
 namely, in the middle of the last 8 inches of the depth. If  
 had been 42 inches, the upper diameter might have been  
 nches from the top; but if 44 inches, then it would have  
 ent to take five diameters, in which case the upper diame-  
 all at 2 inches from the top; namely, in the middle of the  
 ches of the depth; and in like manner for any other depths.

#### BY THE TABLE OF ALE AREAS.

##### *To find the area.*

g found the area corresponding to each mean  
 as directed in Rule I.; those areas may be en-  
 the Note Book, opposite to their respective dia-  
 s below.

#### NOTE BOOK.

<i>B.'s Copper, No. 1, gauged Jan. 23, 1821.</i>							
as es.	Depths from the bottom.	Cross Diame- ters.		Sum.	Mean Dia- meters.		Areas.

	5	44.5	44.7	89.2	44.6	<i>aa</i>	5.54

## BY THE SLIDING RULE.

In order to *prove* or *check* the results obtained by the Table of Ale Areas, it will be necessary to find the area of each section by the Sliding Rule, which may be done by either of the following proportions: As the circular divisor, 359.05, on A, is to the mean diameter on B; so is the mean diameter on A, to the area on B. Or, As the circular gauge-point, 18.95, on D, is to unity on C; so is the mean diameter on D, to the area on C. (See Prob. XIII., Part IV.)

$$\begin{array}{cccc} \text{On A.} & \text{On B.} & \text{On A.} & \text{On B.} \\ \text{As } 359.05 : \left\{ \begin{array}{l} 50.6 \\ 51.5 \\ 48.5 \\ 44.6 \end{array} \right\} :: \left\{ \begin{array}{l} 50.6 \\ 51.5 \\ 48.5 \\ 44.6 \end{array} \right\} : \left\{ \begin{array}{l} 7.13 \text{ section } dd. \\ 7.39 \text{ section } cc. \\ 5.55 \text{ section } bb. \\ 5.54 \text{ section } aa. \end{array} \right. \end{array}$$

Or,

$$\begin{array}{cccc} \text{On D.} & \text{On C.} & \text{On D.} & \text{On C.} \\ \text{As } 18.95 : 1 : \left\{ \begin{array}{l} 50.6 \\ 51.5 \\ 48.5 \\ 44.6 \end{array} \right\} : \left\{ \begin{array}{l} 7.13 \text{ section } dd. \\ 7.39 \text{ section } cc. \\ 6.55 \text{ section } bb. \\ 5.54 \text{ section } aa. \end{array} \right. \end{array}$$

*Note.* The depth, mean diameters, and areas, are transferred to the Specimen of the Dimension Book, at the end of this section.

## REMARK.

It is immaterial whether we begin at the top or the bottom section to find the areas. In the last example, we have begun at the uppermost section, and found the areas downwards, in succession; but in most of the following Problems, the areas of the sections are found in the same order that the dimensions are taken. It may, however, be observed, that it is found most convenient in the practice of *gauging* and *fixing* Victuallers' Utensils, to enter the dimensions and areas, in the Officer's Dimension Book, in such a manner that the dimensions of the uppermost section and its area may stand at the top of the

book ; and the other dimensions and areas follow in succession. (See the Note Book ; and also the Specimen of the Dimension Book at the end of this Section.)

*To find the content of the foregoing copper.*

*As the diameters are taken in the middle of every 10 inches, we have (by removing each decimal point one place towards the right) 55.4 ale gallons, the content of the first 10 inches from the bottom ; 65.5, the content of the second 10 inches ; 73.9, the content of the third 10 inches ; and 71.3, the content of the fourth 10 inches : Then,*

*Ale Gallons.*

55.4

65.5

73.9

71.3

266.1 *whole content.*

2. How many ale gallons are contained in the foregoing copper, when the mean depth of the liquor is 24.8 inches ?

CONTENTS.

*Ale Gallons.*

55.4 *first 10 inches*

65.5 *second 10 inches*

$7.39 \times 4.8 = 35.472$  *upper 4.8 inches.*

156.372 *Ans.*

3. The first mean diameter of a copper, taken at the distance of 3 inches from the bottom, measures 48.4 inches ; the second at 9 inches from the bottom, 54.6 inches ; the third at 15 inches from the bottom, 57.6 inches ; the fourth at 21 inches from the bottom, 59.2 inches ; the fifth at 27 inches from the bottom, 56.8 inches ; and the sixth at 34.2 inches from the bottom, namely, in the middle of the last 8.4 inches of the depth, measures 54.4 inches ; required the area of each section, and the

whole content in ale gallons ; the mean depth being 38.4 inches.

*Ans.* By Rule II., the area of the first section is found to be 6.52, the area of the second section 8.30, the area of the third section 9.24, the area of the fourth section 9.76, the area of the fifth section 8.98, and the area of the sixth section 8.24 ale gallons.

Also, the content of the first 6 inches from the bottom, is 39.12 ; the content of the second 6 inches, 49.8 ; the content of the third 6 inches, 55.44 ; the content of the fourth 6 inches, 58.56 ; the content of the fifth 6 inches, 53.88 ; and the content of the last 8.4 inches, 69.216 ale gallons ; hence the whole content of the copper is 326.016 ale gallons.

#### REMARK.

The coppers of Victuallers have, in general, *falling* crowns ; but should you meet with a Victualler's copper that has a *rising* crown, you must proceed, in every respect, as directed in the last Problem ; namely, by quartering the copper ; taking cross diameters ; measuring the mean depth half-way between the side of the copper and the centre of the crown, &c. &c.

### PROBLEM IV.

*To gauge and fix an under back.*

Under backs have, in general, either rectangular, circular, or elliptical bases ; and perpendicular sides.

*To take the dimensions.*

If the back be rectangular, with some convenient instrument take the mean length and breadth ; if it be circular, take cross diameters, from which find the mean diameter ; and if it be elliptical, measure the transverse and conjugate diameters. Also, take the perpendicular depth, and enter all the dimensions in your Note Book.

*To find the area and content.*

**RULE.**

If the back be rectangular, divide the product of the length and breadth by 282; if it be circular, divide the square of the mean diameter by 359.05; and if it be elliptical, divide the product of the two diameters by 359.05; and the respective quotients will be the area of the base in ale gallons. Multiply this area by the perpendicular depth, and the product will be the content in ale gallons.

*Note.* When the sides of an under-back are not perpendicular to the base, it must be gauged in the same manner as a guile-tun. (See Problems VI., VII., VIII., IX., and X., of this Section.)

**EXAMPLES.**

1. The mean length of a rectangular under-back, is 58.6 inches, the mean breadth 40.4 inches, and the perpendicular depth 25.8 inches; required the area and content, in ale gallons.

**BY THE PEN.**

## BY THE SLIDING RULE.

The proportions for rectangular, circular, and elliptical vessels, may be seen in Problems II., XIII., and XVI., Part IV.; and Problems II., and IV., Part V.

*To find the area.*

On A.	On B.	On A.	On B.
As 282	: 58.6	:: 40.4	: 8.40 area.

*To find the content.*

On A.	On B.	On A.	On B.
As 1	: 8.4	:: 25.8	: 216.72 content.

*Note.* The dimensions and area are transferred to the Specimen of the Dimension Book, at the end of this Section.

2. Required the area and content of a cylindrical under-back, whose mean diameter is 38.6, and depth 32.4 inches.

*Ans.* The area is 4.15, and the content 134.46 ale gallons.

3. Required the area and content of an elliptical under-back, whose transverse diameter is 58.6, conjugate 40.4, and depth 28.6 inches.

*Ans.* The area is 6.59, and the content 188.474 ale gallons.

## REMARK.

Circular and elliptical backs or coolers are not unfrequently met with in Victuallery; and are gauged and fixed precisely in the same manner as under-backs. A constant dipping place is found as directed in the next Problem.

*Note.* Elliptical coolers are generally wider at the top than at the bottom; hence it is necessary to take the transverse and conjugate diameters at such a distance from the base, as will give the mean area of the liquor.

## PROBLEM V.

*To gauge and fix a rectangular back or cooler.*

*To take the dimensions.*

*(See the following figure.)*

With your dimension-tape, take the breadth of the end A D. Double the tape, and extend it from A to E, at which place make a mark, on the cooler, with chalk; and you will have divided the end A D into two equal parts. Find the middle of the end B C, and also the middle of the sides A B and C D, in the same manner; then with your dimension-cane or other proper instrument, measure the mean length E F, and the mean breadth G H; and enter the dimensions in your Note Book.

Now, as coolers are always fixed in an inclining position, in order that the wort may drain off, it is necessary to take the depth of the liquor in several places, and divide the sum of these depths by their number for a mean depth. If ten dips be taken, the division may be performed by removing the decimal point one place towards the left.

*Note.* When a cooler is placed in such a situation that you cannot get round it, a plank may be thrown across it, to enable you to take dips in various parts of the cooler, in order to obtain the mean depth with as much accuracy as possible.

*To find a constant dipping-place.*

As it would be very inconvenient for an Officer to determine the mean depth of the wort, as directed in the last article, every time he has to gauge a cooler, it is necessary to find a constant dipping-place, which may be done in the following manner: Having obtained the mean depth, as already directed, try in different parts of the cooler, until you find a place where the depth of the liquor exactly coincides with the mean depth; then make a mark upon the side of the cooler, with white paint, composed of white lead and oil, as at  $x$ ; and you will

have a constant dipping-place, which will always give you the mean depth, whatever liquor may be in the cooler.

For the sake of convenience the constant dipping-place should not be far from the side of the cooler; but should you not be able to find a suitable place near the side, fix upon the most convenient part of the cooler, and observe whether the depth taken there be more or less than the mean depth. If it be less, the deficiency must be added; but if it be more, the excess must be subtracted. For example, suppose the mean depth to be 4.5, and the depth at the constant dipping-place 4.2; then .3 must be added; but if the depth at  $x$  be 4.7, then .2 must be subtracted.

The number to be added must be marked upon the side of the cooler, with paint, thus,  $+.3$ ; and the number to be subtracted thus,  $-.2$ . The first of these numbers is read, *plus three-tenths*; and the second, *minus two-tenths*.

*Note.* If the cooler be empty, it will be necessary to cover its bottom with water, in order to find a mean dipping-place.

*To find the area and content.*

### RULE.

Multiply the mean length by the mean breadth, divide the product by 282; and the quotient will be the area in ale gallons. Multiply this area by the mean depth, and the product will be the content in ale gallons.

### EXAMPLES.

1. The mean length E F of a cooler is 116.8 inches, the mean breadth G H 68.2 inches, and the depths of the wort, taken in ten different places, as below; required the area and content in ale gallons.

*Depth in Inches.*

<i>At a</i>	=	4.8
<i>b</i>	=	4.2
<i>c</i>	=	4.2
<i>d</i>	=	4.5
<i>e</i>	=	4.4
<i>g</i>	=	4.6
<i>h</i>	=	4.5
<i>k</i>	=	4.9
<i>m</i>	=	4.8
<i>n</i>	=	4.6

BY THE SLIDING RULE.

*To find the area.*

As the square divisor on A, is to the length on B ; so is the breadth on A, to the area on B.

On A.      On B.      On A.      On B.  
As 282 : 116.8 :: 68.2 : 28.25 ale gallons.

*To find the content.*

As unity on A, is to the area on B ; so is the depth on A, to the content on B.

On A.      On B.      On A.      On B.  
As 1 : 28.25 :: 4.5 : 127.13 ale gallons.

*Note 1.* The length, breadth, and area are transferred to the specimen of the Dimension Book, at the end of this Section.

2. It appears from the foregoing depths that the constant dipping-place may be either at *d* or *h* ; but as both these places would be inconvenient for that purpose, it will be necessary to fix upon one nearer to the side of the cooler, as at *x*.

3. The method of deducting the *heat* from *warm* wort is described in Problem XIII.

2. If the mean depth of the wort, in the foregoing cooler, be 6.4 inches ; how many ale gallons does it contain ?

*Ans.* 180.8 ale gallons.

3. The mean length of a victualler's cooler, is 98.3 inches, the mean breadth 74.8 inches, and the mean depth

of the wort 7.2 inches ; required the area and content in ale gallons.

*Ans.* The area is 26.07, and the content 187.704 ale gallons.

#### REMARK.

The bases of coolers are more commonly rectangles than any other figures ; if, however, the base of a cooler be a rhombus or rhomboides, its area may be found by Problem III. ; if a triangle, by Problem IV. or V. ; if a trapezium, by Problem VI. ; if a trapezoid, by Problem VII. ; if an irregular polygon, by Problem VIII. ; if a regular polygon, by Problem IX. or X. ; if a circle, by Problem XIII. ; if the sector of a circle, by Problem XIV. ; if the segment of a circle, by Problem XV. ; if an ellipse, by Problem XVI. ; if the segment of an ellipse, by Problem XVII. ; if a parabola, by Problem XVIII. ; if a compound figure, by Problem XIX. ; and if an oval greater or less than a true ellipse, or any other indetermined, curvilinear figure, its area may be found by the method of equi-distant ordinates, as described in Problem XX., Part IV.

*Note.* When victuallers' coolers are in the form of ovals greater or less than true ellipses, it becomes absolutely necessary to *gauge* and *fix* them by the method of equi-distant ordinates. But after the numerous examples that have been given in Problem XX., Part IV., it would be quite superfluous again to introduce this subject. It is only necessary to observe, that any figure in that Problem may be considered as the base of a cooler ; and that the method of taking the dimensions and of finding the area, in the *real* Practice of Gauging, is precisely the same as there described. The manner of entering the dimensions and area, in the Officer's Dimension Book, is shown at the end of this Section.

#### PROBLEM VI.

*To gauge and fix a guile-tun in the form of the frustum of a cone.*

*To take the dimensions.*

First quarter the tun, as directed in Problem III. ;

then take cross diameters in the middle of every 6, 8, or 10 inches; also, measure the perpendicular depth, and enter all the dimensions in your Note Book.

*Note 1.* If it be thought more convenient, both the top and bottom of the tun may be quartered, as directed in Problem III., Part VI.; care, however, must be taken to make the quartering points at the top and bottom, correspond with each other, in position, which may be done by setting off the two first points upon the joint made by any two adjoining staves. The quartering lines may then easily be drawn upon the sides of the tun, or struck by a chalk-line.

It may also be observed, that the perpendicular distances between the horizontal sections, must be *set off* upon the quartering lines in the same manner as directed in that Problem.

2. When the sides of the tun are much inclined, it will be necessary to take cross diameters in the middle of every 6 or 8 inches, in order to obtain the content with more accuracy.

### *To find the area and content.*

#### RULE.

Find the area corresponding to each mean diameter, in the Table of *Ale Areas*, Part VII.; then multiply each area by its respective depth; and the sum of the products will be the whole content required. (See Prob. XIII., Part IV.)

*Note.* The area and content may also be found by Rule II., Prob. III.

#### EXAMPLES.

1. Let the following figure A B C D represent a guile-tun in the form of the frustum of a cone, whose perpendicular depth  $m n$  is 42 inches; the mean diameter  $a a$ , taken at 5 inches from the bottom, 63.7 inches; the diameter  $b b$ , taken at 15 inches from the bottom, 66.2 inches; the diameter  $c c$ , taken at 25 inches from the bottom, 68.7 inches; and the diameter  $d d$ , taken at 36 inches from the bottom, 71.4 inches; required the area of each section, and the whole content in ale gallons.

*Note.* The first three diameters are taken in the middle of every 10 inches; but the fourth diameter is taken in the middle of the last 12 inches of the depth.

BY THE TABLE OF ALE AREAS.

*To find the area.*

Having found the area of each section, as directed in the Rule, the dimensions and areas will appear in the Note Book, as exhibited below.

#### NOTE BOOK.

<i>A. B.'s Guile Tun, No. 1, gauged Jan. 28, 1821.</i>				
Divisions ■ Inches.	Depths from the Bottom.	Mean Diameters.		Areas.
12	36	71.4	<i>dd</i>	14.20
10	25	68.7	<i>cc</i>	13.14
10	15	66.2	<i>bb</i>	12.21
10	5	63.7	<i>aa</i>	11.30

BY THE SLIDING RULE.

As the circular divisor, 359.05, on A, is to the mean diameter on B; so is the mean diameter on A, to the area on B. Or, As the circular gauge-point, 18.95, on D, is to unity on C; so is the mean diameter on D, to the area on C. (See Prob. XIII., Part IV.; and also Prob. III., Part VI.)

	On A.	On B.		On A.	On B.
<i>As</i> 359.05 :	$\left\{ \begin{array}{c} 71.4 \\ 68.7 \\ 66.2 \\ 63.7 \end{array} \right\}$	$\left\{ \begin{array}{c} 71.4 \\ 68.7 \\ 66.2 \\ 63.7 \end{array} \right\}$	::	$\left\{ \begin{array}{c} 71.4 \\ 68.7 \\ 66.2 \\ 63.7 \end{array} \right\}$	: $\left\{ \begin{array}{l} 14.20 \text{ section } dd. \\ 13.14 \text{ section } cc. \\ 12.21 \text{ section } bb. \\ 11.30 \text{ section } aa. \end{array} \right.$

*Note.* The depth, mean diameters, and areas are transferred to the specimen of the Dimension-Book, at the end of this Section.

*To find the content.*

*Contents.*

*Ale gal.*

113.0 *first 10 inches.*

122.1 *second 10 inches.*

131.4 *third 10 inches.*

14.2  $\times$  12 = 170.4 *upper 12 inches.*

536.9 *whole content.*

*Note.* The bottom diameter of the foregoing guile-tun, is 62.4 inches, the top diameter 72.9 inches, and the perpendicular depth 42 inches; from which dimensions we find the *true* content, by Rule I., Prob. VIII., Part V., to be 536.4 ale gallons. Hence it appears that the Rule in this Problem gives the content only half a gallon too much, in 536 gallons.

2. How many ale gallons are contained in the foregoing guile-tun, when the depth of the liquor is 32.4 inches?  
*Ans.* 398.036 *ale gallons.*

3. The perpendicular depth of a guile-tun is 38 inches; the mean diameter taken at 5 inches from the bottom, 51.1 inches; the diameter taken at 15 inches from the bottom, 53.2 inches; the diameter taken at 25 inches from the bottom, 55.3 inches; and that taken at 34 inches from the bottom, 57.2 inches; required the area of each section, and the whole content of the guile-tun, in ale gallons.

*Note.* The first three diameters are taken in the middle of every 10 inches; but the fourth diameter is taken in the middle of the last 8 inches of the depth.

*Ans.* The area of the first section is 7.27, the second

*section 7.88, the third section 8.52, and the area of the fourth section 9.11 ale gallons; hence we find the whole content of the tun to be 309.58 ale gallons.*

## PROBLEM VII.

*To gauge and fix a circular guile-tun, with curved sides.*

*To take the dimensions.*

Quarter the tun, as directed in Problem III.; then take cross diameters in the middle of every 6, 8, or 10 inches; also, measure the perpendicular depth, and enter all the dimensions in your Note Book.

*Note.* When the sides are much curved, cross diameters must be taken in the middle of every 6 or 8 inches.

*To find the area and content.*

## RULE.

Find the area corresponding to each mean diameter, in the Table of *Ale Areas*, Part VII.; then multiply each area by its respective depth; and the sum of the products will be the whole content of the tun. (See Prob. XIII., Part IV.)

*Note 1.* The area and content may also be found by Rule II., Prob. III.

2. A circular guile-tun is sometimes made of a hogshead, puncheon, or pipe, standing upon one end; the other end being sawn off, or taken out.

## EXAMPLES.

1. Let the following figure A B C D, represent a circular guile-tun, whose perpendicular depth is 40 inches; the mean diameter, taken at 4 inches from the bottom, 46.3 inches; the diameter taken at 12 inches from the bottom, 49.6 inches; the diameter taken at 20 inches from the bottom, 53.2 inches; the diameter taken at 28 inches from the bottom, 54.4 inches; and that taken at 36 inches from the bottom, 50.8 inches; required the

area of each section, and the whole content, in ale gallons.

BY THE TABLE OF ALE AREAS.

*To find the area.*

Having found the area of each section, as directed in the Rule, the dimensions and areas will appear in the Note Book, as below.

### NOTE BOOK.

<i>A. B.'s Guile Tun, No. 2, gauged Jan. 23, 1821.</i>			
Divisions in Inches.	Depths from the Bottom.	Mean Diameters.	Areas.
II	56	50.8	7.19
8	28	54.4	8.24
8	20	58.2	7.88
8	12	49.6	6.85
8	4	46.8	5.97

BY THE SLIDING RULE.

As the circular divisor, 859.05, on A, is to the mean diameter on B; so is the mean diameter on A, to the area on B. Or, As the circular gauge-point, 18.95, on D, is to

any on C; so is the mean diameter on D, to the area on C. (See Prob. XIII., Part IV.; and also Probs. III. and VI., Part VI.)

$$\begin{array}{cccc} \text{On A.} & \text{On B.} & \text{On A.} & \text{On B.} \\ & \left\{ \begin{array}{l} 50.8 \\ 54.4 \\ 58.2 \\ 49.6 \\ 46.3 \end{array} \right\} & :: & \left\{ \begin{array}{l} 50.8 \\ 54.4 \\ 58.2 \\ 49.6 \\ 46.3 \end{array} \right\} \\ \text{As } 359.05 : & & & \left\{ \begin{array}{l} 7.19 \text{ fifth section.} \\ 8.24 \text{ fourth section.} \\ 7.88 \text{ third section.} \\ 6.85 \text{ second section.} \\ 5.97 \text{ first section.} \end{array} \right\} \end{array}$$

*Note.* The dimensions and areas are transferred to the specimen of the Dimension Book, at the end of this Section.

## BY THE PEN.

*To find the content.*

Areas. Ale gallons.		Depths. Inches.		Contents. Ale gallons.
5.97	x	8	=	47.76 first 8 inches.
6.85	x	8	=	54.80 second 8 inches.
7.88	x	8	=	63.04 third 8 inches.
8.24	x	8	=	65.92 fourth 8 inches.
7.19	x	8	=	57.52 fifth 8 inches.
				<u>289.04 whole contents.</u>

## BY THE SLIDING RULE.

As one on A, is to the area on B; so is the depth on A, to the content on B.

$$\begin{array}{cccc} \text{On A.} & \text{On B.} & \text{On A.} & \text{On B.} \\ & \left\{ \begin{array}{l} 5.97 \\ 6.85 \\ 7.88 \\ 8.24 \\ 7.19 \end{array} \right\} & :: & \left\{ \begin{array}{l} 8 \\ 8 \\ 8 \\ 8 \\ 8 \end{array} \right\} \\ \text{As } 1 : & & & \left\{ \begin{array}{l} 47.76 \text{ first 8 inches.} \\ 54.80 \text{ second 8 inches.} \\ 63.04 \text{ third 8 inches.} \\ 65.92 \text{ fourth 8 inches.} \\ 57.52 \text{ fifth 8 inches.} \end{array} \right\} \\ & & & \underline{\underline{289.04 \text{ whole content.}}}$$

2. Required the number of ale gallons contained in the foregoing guile-tun, when the depth of the liquor is 38.4 inches.

*Ans.* 218.386 ale gallons.

3. The perpendicular depth of a circular guile-tun, made of a wine-pipe, is 42 inches; the mean diameter, taken at 4 inches from the bottom, 28.4 inches; the diameter taken at 12 inches from the bottom, 31.2 inches; the diameter taken at 20 inches from the bottom, 32.6 inches; the diameter taken at 28 inches from the bottom, 31.5 inches; and that taken at 37 inches from the bottom, 29.8 inches; required the area of each section, and the whole content in ale gallons.

*Ans.* The area of the first section is 2.25, the second 2.71, the third 2.96, the fourth 2.76, and the fifth 2.47 ale gallons; hence we find the whole content to be 110.14 ale gallons.

### PROBLEM VIII.

*To gauge and fix a guile-tun in the form of the frustum of an elliptical cone.*

*To take the dimensions.*

By Problem XXIX., Part III., or by repeated trials, as directed in Note 1, Problem XX., Part IV., find the transverse and conjugate diameters of the bottom of the tun. Also, find the extremities of the transverse and conjugate diameters of the top of the tun; then, draw lines, with chalk, up the inside of the vessel, from the extremities of the bottom diameters to the extremities of the top diameters; and the tun will be *truly* quartered.

Next, make marks upon the quartering lines, in the middle of every 6, 8, or 10 inches, as directed in Problem III., Part VI.; measure the transverse and conjugate diameters of each section; also take the perpendicular depth of the vessel, and enter all the dimensions in your Note Book.

*To find the area and content.*

### RULE.

Multiply the transverse diameter of the first section, by the conjugate; divide the product by 359.05; and the quotient will be the area in ale gallons. Find the area of each section in the same manner; then, multiply each area by its respective depth; and the sum of the products will be the whole content of the tun.

### EXAMPLES.

1. The perpendicular depth of a guile-tun in the form of the frustum of an elliptical cone, is 80 inches; the transverse and conjugate diameters, taken at 5 inches from the bottom, measure 34.2 and 25.3 inches; at 15 inches from the bottom, 40.5 and 29.6 inches; and at 25 inches from the bottom, 46.4 and 33.8 inches; required the area of each section, and the whole content of the tun, in ale gallons.

### BY THE PEN.

*To find the area.*

Here  $34.2 \times 25.3 \div 359.05 = 865.26 \div 359.05 = 2.409$  ale gallons, the area of the first section;  $40.5 \times 29.6 \div 359.05 = 1198.80 \div 359.05 = 3.338$  ale gallons, the area of the second section; and  $46.4 \times 33.8 \div 359.05 = 1568.32 \div 359.05 = 4.367$  ale gallons, the area of the third section.

### BY THE SLIDING RULE.

As the circular divisor on A, is to the transverse diameter on B; so is the conjugate diameter on A, to the area on B.

On A.	On B.	On A.	On B.
	$\left\{ \begin{array}{l} 34.2 \\ 40.5 \\ 46.4 \end{array} \right\}$	$\left\{ \begin{array}{l} 25.3 \\ 29.6 \\ 33.8 \end{array} \right\}$	$\left\{ \begin{array}{l} 2.41 \text{ first section.} \\ 3.34 \text{ second section.} \\ 4.37 \text{ third section.} \end{array} \right\}$
As 359.05 :			

C c 2

The dimensions and areas will appear in the Note Book, as below.

### NOTE BOOK.

<i>A. B.'s Guile Tun, No. 3, gauged April 12, 1881.</i>			
Divisions in Inches.	Depths from the Bottom.	Transverse and Conjugate Diameters.	Area.
10	25	T. 46.4 } C. 33.8 }	4.37
10	15	T. 40.5 } C. 29.6 }	3.84
10	5	T. 34.2 } C. 25.3 }	2.41

*Note.* The dimensions and areas are transferred to the specimen of the Dimension Book, at the end of this Section.

*To find the content.*

*Contents.*

*Ale gallons.*

24.1 *first 10 inches.*

38.4 *second 10 inches.*

43.7 *third 10 inches.*

101.2 *whole content.*

2. Required the number of ale gallons contained in the foregoing guile-tan, when the depth of the liquor is 23.4 inches.

*Ans.* 72.358 ale gallons.

3. The perpendicular depth of an elliptical guile-tun is 40 inches; the transverse and conjugate diameters, taken at 5 inches from the bottom, measure 49.6 and 37.8 inches; at 15 inches from the bottom, 55.4 and 41.7 inches; at 25 inches from the bottom, 61.6 and 46.2 inches; and at 35 inches from the bottom, 67.8 and 50.5

inches ; required the area of each section, and the whole content of the tun, in ale gallons.

*Ans.* The area of the first section is 5.22, the second 6.48, the third 7.93, and the fourth 9.47 ale gallons ; hence we find the whole content to be 290.5 ale gallons.

### PROBLEM IX.

*To gauge and fix a guile-tun with an elliptical base and a circular top, generally called a cylindroid.*

*To take the dimensions.*

Find the transverse and conjugate diameters of the bottom of the tun, as in the last Problem. Also, quarter the top, as directed in Problem III. ; taking care to make the quartering points at the top and bottom, correspond with each other, in position.

Having thus quartered the tun, measure transverse and conjugate diameters in the middle of every 6, 8, or 10 inches ; also take the perpendicular depth of the vessel, and enter all the dimensions in your Note Book.

*To find the area and content.*

Divide the product of the two diameters of the first section, by 359.05 ; and the quotient will be the area in ale gallons. Find the area of each section, by a similar process ; then multiply each area by its corresponding depth, and the sum of the products will be the content required.

*Note.* As the base of a cylindroid is an ellipse and the top a circle, it is evident that the horizontal sections taken in the middle of every 6, 8, or 10 inches, cannot be *true* ellipses ; consequently the areas found by the above Rule, will not be *mathematically* correct ; although near enough the truth for all practical purposes. (See Remarks at the end of Problem IX., Part V.).

### EXAMPLES.

1. The perpendicular depth of a guile-tun in the form.

C c 3.

of a cylindroid, is 30 inches; the transverse and conjugate diameters, taken at 5 inches from the bottom, measure 44.3 and 37.6 inches; at 15 inches from the bottom, 39.8 and 35.9 inches; and at 25 inches from the bottom, 35.6 and 33.8 inches; required the area of each section, and the whole content of the tun, in ale gallons.

BY THE PEN.

*To find the area.*

Here  $44.3 \times 37.6 \div 359.05 = 1665.68 \div 359.05 = 4.639$  ale gallons, the area of the first section;  $39.8 \times 35.9 \div 359.05 = 1428.82 \div 359.05 = 3.979$  ale gallons, the area of the second section; and  $35.6 \times 33.8 \div 359.05 = 1203.28 \div 359.05 = 3.351$  ale gallons, the area of the third section.

BY THE SLIDING RULE.

As the circular divisors on A, is to the transverse diameter on B; so is the conjugate diameter on A, to the area on B.

On A.	On B.	On A.	On B.
As 359.05 :	$\left\{ \begin{array}{l} 44.3 \\ 39.8 \\ 35.6 \end{array} \right\}$	:: $\left\{ \begin{array}{l} 37.6 \\ 35.9 \\ 33.8 \end{array} \right\}$ :	$\left\{ \begin{array}{l} 4.64 \text{ first section.} \\ 3.98 \text{ second section.} \\ 3.35 \text{ third section.} \end{array} \right\}$

The dimensions and areas will appear in the Note Book, as below.

### NOTE BOOK.

A. B.'s Guile Tun, No. 4, gauged April 18, 1821.			
Divisions in Inches.	Depths from the Bottom.	Transverse and Conjugate Diameters.	Areas.
10	25	T. 35.6 } C. 33.8 }	3.35
10	15	T. 39.8 } C. 35.9 }	3.98
10	5	T. 44.3 } C. 37.6 }	4.64

*To find the content.*

*Contents.*

*Ale Gallons.*

46.4 *first 10 inches.*

39.8 *second 10 inches.*

33.5 *third 10 inches.*

119.7 *whole content.*

2. How many gallons are contained in the foregoing guile-tun, when the depth of the liquor is 26.7 inches?

*Ans. 108.645 ale gallons.*

3. The perpendicular depth of a guile-tun in the form of a cylindroid, is 40 inches; the transverse and conjugate diameters, taken at 5 inches from the bottom, measure 62.7 and 55.4 inches; at 15 inches from the bottom, 58.8 and 53.6 inches; at 25 inches from the bottom, 54.9 and 51.8; and at 35 inches from the bottom 50.8 and 49.7 inches; required the area of each section, and the whole content of the tun, in ale gallons.

*Ans. The area of the first section is 9.67, the second 8.78, the third 7.92, and the fourth 7.08 ale gallons; hence we find the whole content to be 334 ale gallons.*

## PROBLEM X.

*To gauge and fix a guile-tun in the form of the frustum of a square pyramid.*

*To take the dimensions.*

With some convenient instrument take the perpendicular depth of the tun; also, measure the side of the tun in the middle of every 6, 8, or 10 inches; and enter all the dimensions in your Note Book.

*Note 1.* The perpendicular distances between the horizontal sections, must be *set off* upon the inside of the vessel, as directed in Problem III., Part VI.

2. As vessels that assume the form of the frustum of a square pyramid, are seldom perfectly square, it is necessary to measure each side, and divide the sum of the sides by 4, to find the mean side.

3. Guile Tuns with circular or elliptical bases are generally termed *Rounds*; and those with square or rectangular bases, are denominated *Squares*. (See Remarks at the end of Prob. VI., Sect. II., Part VI.)

*To find the area and content.*

### RULE.

Multiply the side of the first horizontal section by itself; divide the product by 282, and the quotient will be the area in ale gallons.

Find the area of each section in the same manner; then multiply each area by its respective perpendicular depth; and the sum of the products will be the whole content, in ale gallons.

### EXAMPLES.

1. The perpendicular depth  $mn$ , of the guile-tun ABCD, in the form of a frustum of a square pyramid; is 82 inches; the mean side  $aa$ , 5 inches from the bottom, 38.2; the side  $bb$ , 15 inches from the bottom, 40.4; and the side  $cc$ , 26 inches from the bottom, 48.6 inches; required the area of each section, and the whole content, in ale gallons.

BY THE PEN.

*To find the area.**Inches.**33.2 mean side a a.**33.2 ditto.*

$$\begin{array}{r} 664 \\ 996 \\ 996 \end{array}$$
*Divisor 282)1102.24(3.908 area in ale gallons.*

*Also,  $40.4 \times 40.4 \div 282 = 1632.16 \div 282 = 5.787$  ale gallons, the area of the second section; and  $48.6 \times 48.6 \div 282 = 2361.96 \div 282 = 8.375$  ale gallons, the area of the third section.*

BY THE SLIDING RULE.

*As the square divisor on A, is to the mean side on B; so is the mean side on A, to the area on B. Or, as the square gauge-point on D, is to unity on C; so is the mean side on D, to the area on C.*

*On A.    On B.    On A.    On B.*  
*As 282 :  $\left\{ \begin{array}{l} 33.2 \\ 40.4 \\ 48.6 \end{array} \right\} :: \left\{ \begin{array}{l} 33.2 \\ 40.4 \\ 48.6 \end{array} \right\} : \left\{ \begin{array}{l} 3.91 \text{ first section.} \\ 5.79 \text{ second section.} \\ 8.38 \text{ third section.} \end{array} \right.$*

*The dimensions and areas will appear in the Note Book, as below.*

## NOTE BOOK.

<i>A. B.'s Sq. Guile Tun, No. 1, gauged March 6, 1821.</i>			
<i>Divisions in Inches.</i>	<i>Depths from the Bottom.</i>	<i>Mean Sides.</i>	<i>Areas.</i>
12	26	48.6	8.38
10	15	40.4	5.79
10	5	33.2	3.91

*Note.* The dimensions and areas are transferred to the specimen of the Dimension Book, at the end of this Section.

*To find the content.*

*Contents.*

*Ale gallons.*

39.1 *first 10 inches.*

57.9 *second 10 inches.*

$8.38 \times 12 = 100.56$  *upper 12 inches.*

197.56 *whole content.*

2. How many ale gallons are contained in the foregoing guile-tun, when the depth of the liquor is 27.8 inches?

*Ans.* 162.864 ale gallons.

3. The side of a square, pyramidical guile-tun, at 5 inches from the bottom, measures 49.2; at 15 inches from the bottom, 52.3; at 25 inches from the bottom, 55.2; at 35 inches from the bottom, 58.4; at 45 inches from the bottom, 61.2 inches; required the area of each section, and the whole content, in ale gallons; its perpendicular depth being 52 inches.

*Note.* The first four dimensions are taken in the middle of every 10 inches; but the fifth dimension is taken in the middle of the last 12 inches of the depth.

*Ans.* The area of the first section is 8.58, the second section 9.70, the third section 10.81, the fourth section 12.09, and the fifth section 13.28 ale gallons; hence we find the whole content of the tun to be 571.16 ale gallons.

## PROBLEM XI.

*To gauge and fix a guile-tun in the form of the frustum of a rectangular pyramid, or a prismoid.*

*To take the dimensions.*

With some convenient instrument take the perpendicular depth of the vessel; also, measure the mean length

and breadth in the middle of every 6, 8, or 10 inches ; and enter all the dimensions in your Note Book.

*Note.* Measure both sides of the vessel, divide the sum by 2, and take the quotient for the mean length. The mean breadth must be found in the same manner.

*To find the area and content.*

### RULE.

Multiply the mean length of each section by the mean breadth ; divide each product by 282 ; and the quotients will be the areas of the respective sections, in ale gallons. Multiply the area of each section by its respective perpendicular depth ; and the sum of the products will be the whole content of the tun, in ale gallons.

### EXAMPLES.

1. The perpendicular depth of a guile-tun, in the form of the frustum of a rectangular pyramid, is 30 inches ; the mean length and breadth, taken at 5 inches from the bottom, measure 36 and 26 inches ; at 15 inches from the bottom, 42 and 32 inches ; and at 25 inches from the bottom, 48 and 38 inches ; required the area of each section, and the whole content, in ale gallons.

### BY THE PEN.

*To find the area.*

$$\begin{array}{r}
 \text{Inches.} \\
 36 \text{ length.} \\
 26 \text{ breadth.} \\
 \hline
 216 \\
 72
 \end{array}$$

*Divisor 282)936(3.319 area in ale gallons.*

*Also,  $42 \times 32 \div 282 = 1344 \div 282 = 4.765$  ale gallons, the area of the second section ; and  $48 \times 38 \div 282 = 1824 \div 282 = 6.468$  ale gallons, the area of the third section.*

## BY THE SLIDING RULE.

As the square divider on A, is to the length on B; so is the breadth on A, to the area on B.

$$\begin{array}{ccccccc} \text{On A.} & \text{On B.} & \text{On A.} & \text{On B.} & & & \\ \text{As } 282 : & \left\{ \begin{array}{l} 36 \\ 42 \\ 48 \end{array} \right\} :: & \left\{ \begin{array}{l} 26 \\ 32 \\ 38 \end{array} \right\} : & \left\{ \begin{array}{l} 3.32 \text{ first section.} \\ 4.77 \text{ second section.} \\ 6.47 \text{ third section.} \end{array} \right. & & & \end{array}$$

The dimensions and areas will appear in the Note Book, as below.

*Contents.*

*Ale gallons.*

33.2 first 10 inches.

47.7 second 10 inches.

64.7 third 10 inches.

145.6 whole content.

2. How many ale gallons are contained in the foregoing guile-tun, when the depth of the liquor is 26.3 inches?  
*Ans.* 121.661 ale gallons.

3. The perpendicular depth of a guile-tun, in the form of a prismoid, is 40 inches; the mean length and breadth, taken at 5 inches from the bottom, measure 56.4 and 41.2 inches; at 15 inches from the bottom, 60.8 and 44.8 inches; at 25 inches from the bottom, 65.7 and 48.6; and at 35 inches from the bottom, 71.2 and 51.9; required the area of each section, and the whole content in ale gallons.

*Ans.* The area of the first section is 3.24, the second 9.66, the third 11.32, and the fourth 13.10 ale gallons: hence we find the whole content of the tun to be 423.2 ale gallons.

#### REMARK.

Having given the methods of gauging and fixing all kinds of guile-tuns that generally occur in victuallery, it only remains to observe, that if a guile-tun should be met with whose base is a triangle, a trapezium, a trapezoid, &c. &c. such dimensions must be taken as will give the areas of horizontal sections in the middle of every 6, 8, or 10 inches of the perpendicular depth. Then multiply each area by its corresponding depth; and the sum of the products will be the whole content of the tun. (See the Remark at the end of Prob. V.)

### PROBLEM XII.

#### *The method of gauging by-tubs.*

By-tubs are such vessels as are not fixed in the Officer's Dimension Book. They are generally small, of various and irregular forms; and used by victuallers for cooling their wort, or for working small quantities of beer, when the fixed vessels are too full.

#### *To take the dimensions.*

Whatever be the form of the vessel, such mean dimen-  
 D d

sions must be taken as are most likely to give the true content of the liquor. Thus, if the vessel be a parallelopipedon, measure the mean length and breadth; if it be a cylinder, measure the mean diameter; if it be the frustum of a right cone, measure the mean diameter, at half the perpendicular depth of the liquor, in order to reduce the vessel to a cylinder; and if it be the frustum of an elliptical cone, measure the mean transverse and conjugate diameters, at half the perpendicular depth of the liquor; and when their difference is not great, take half their sum for a mean circular diameter, thus reducing the vessel to a cylinder. Also, in every case, take the mean perpendicular depth of the liquor; and enter all the dimensions in a vacant column of your Survey Book.

*Note 1.* In order to find a mean diameter at half the perpendicular depth of the liquor contained in a vessel in the form of the frustum of a right cone, standing upon its less base, place a rod perpendicularly to the bottom of the vessel, and touching the side; then the distance between the other side of the vessel and the rod, measured at the surface of the liquor, will be the mean diameter sought.—By a similar process you may obtain the mean transverse and conjugate diameters, at half the perpendicular depth of the liquor contained in a vessel in the form of the frustum of an elliptical cone.

2. The foregoing method of reducing a vessel in the form of the frustum of a right cone, or an elliptical cone to a cylinder, is not mathematically correct; but it is generally adopted in practice, because the content of the liquor can be found by the Sliding Rule, without finding the area of the vessel.

### *To find the content.*

#### RULES.

##### BY THE PEN.

1. When the vessel is a parallelopipedon, multiply the mean length, breadth, and depth continually together; divide the last product by 282; and the quotient will be the content in ale gallons.

2. When the vessel is a cylinder, or the frustum of a cone reduced to a cylinder, multiply the square of the mean diameter by the depth of the liquor; divide the

product by 359 ; and the quotient will be the content, in ale gallons.

3. When the vessel is the frustum of an elliptical cone, and not reduced to a cylinder, multiply the product of the mean diameters by the depth of the liquor ; divide this product by 359 ; and the quotient will be the content in ale gallons.

#### BY THE SLIDING RULE.

1. *When the vessel is a parallelopipedon.* -

As the square divisor 282, on A, is to the length on B ; so is the breadth on A, to the area on B. Then, as one on A, is to the area on B ; so is the depth on A, to the content on B.

2. *When the vessel is a cylinder.*

As the circular gauge-point 18.95, on D, is to the depth on C ; so is the mean diameter on D, to the content on C.

3. *When the vessel is the frustum of an elliptical cone.*

As the circular divisor 359, on A, is to the transverse diameter on B ; so is the conjugate diameter on A, to the area on B. Then, as one on A, is to the area on B ; so is the depth on A, to the content on B.

#### EXAMPLES.

1. The mean length of a by-tub is 82.5, the mean breadth 28.3, and the mean depth of the liquor 14.6 inches ; how many gallons of ale does the vessel contain ?

BY THE SLIDING RULE.

*Rule I.*

On A.	On B.	On A.	On B.
As 282	: 32.5	:: 28.3	: 3.26 <i>area.</i>

*And,*

On A.	On B.	On A.	On B.
As 1	: 3.26	:: 14.6	: 47.62 <i>content.</i>

2. The mean diameter of a cylindrical by-tub is 28.8; and the mean depth of the liquor 18.2 inches; what is the content in ale gallons?

## BY THE PEN.

*Rule II.*

Here  $28.8 \times 28.8 \times 18.2 = 829.44 \times 18.2 = 15095.808$ , the square of the mean diameter multiplied by the depth of the liquor; and  $15095.808 \div 359 = 42.049$ , the content in ale gallons.

## BY THE SLIDING RULE.

*Rule II.*

On D.	On C.	On D.	On C.
As 18.95	: 18.2	:: 28.8	: 42.05 content.

3. The mean diameter of a by-tub in the form of the frustum of a right cone, is 25.6, and the depth of the liquor 22.7 inches; what is the content in ale gallons?

*Ans. 41.439 ale gallons.*

4. The mean transverse diameter of a by-tub, in the form of the frustum of an elliptical cone, is 45.3, and the mean conjugate diameter 36.8 inches; what is the content in ale gallons, when the depth of the liquor is 12.7 inches?

*Ans. 58.973 ale gallons.*

## REMARKS.

1. In some places it is customary to cool wort in brass pans or kettles, with falling crowns. In such cases, find the mean diameter as before directed; and take the mean depth of the liquor half way between the side of the vessel and the centre of the crown.

2. Sometimes wort is cooled in *wooden bowls*, somewhat resembling the segment of a sphere. The practical method of gauging such vessels, as by-tubs, is to take the diameter at the surface of the liquor, and half the greatest depth; and then compute the content, from these dimensions, as directed for a cylinder, in the second Rule. No general Rules can however be laid down that will give the contents of irregular vessels with accuracy; and as by-tubs assume such a variety of forms, nothing but experience will enable the Officer to adopt such methods of gauging them as the nature of the vessels may seem to require.

*Note.* By experiments made by filling several wooden bowls with water, from a known measure, we have found that the foregoing Rule gives the content too little, and the Rule for the segment of a sphere gives sometimes too much, and sometimes too little; the following method, however, gives *very nearly* the true content: Take the diameter of the bowl, at the surface of the liquor, and also its greatest depth: To this depth, add two-tenths, for every inch; and take half the sum for the mean depth; and the vessel will be reduced to a cylinder, *nearly*.

**EXAMPLE.** The diameter of the top of a wooden bowl, is 18.2 inches, and its greatest depth 5.9 inches; what is its content in ale gallons?

**SOLUTION.** Here  $\frac{5.9 + 1.18}{2} = \frac{7.08}{2} = 3.54$ , the mean depth; then,  
 $(18.2 \times 18.2 \times 3.54) \div 359 = (881.24 \times 3.54) \div 359 = 1172.5896 \div 359 = 3.2662$ , the content in ale gallons.

*Note.* The number to be added to the depth, may always be obtained by multiplying the depth by two-tenths; thus we have  $5.9 \times .2 = 1.18$ , the number added to the depth, in the above solution.

### PROBLEM XIII.

*To deduct the heat out of victuallers' warm worts.*

It has been found by experience that 10 gallons of hot wort will only measure 9 gallons when cold; therefore, by act of parliament, an allowance of one gallon in every ten must be made, when the wort is gauged hot.

#### CASE I.

*When the number of warm gallons are known.*

*By Subtraction.*

**RULE.**

*By the Pen.*

Write down the number of warm gallons, found by gauge; from this subtract one-tenth of itself; and the remainder will be the number of gallons when cold.

*By Multiplication.*

**RULE.**

Multiply the number of warm gallons by .9, and the product will be the number of gallons when cold.

## EXAMPLES.

1. If a gauge of warm wort be 184.8 gallons; how many gallons must be charged with the duty?

*By Subtraction.*

$$\begin{array}{r}
 \text{Gallons.} \\
 184.8 \\
 18.48 \\
 \hline
 166.32 \text{ Ans.} \\
 \hline
 \hline
 \end{array}$$

*By Multiplication.*

$$\begin{array}{r}
 \text{Gallons.} \\
 184.8 \\
 .9 \\
 \hline
 166.32 \text{ Ans.} \\
 \hline
 \hline
 \end{array}$$

*Note.* The trader must be charged with 166.5 gallons, as .32 is nearer .5 than 0. See the Remark at the end of this Problem.

*By the Sliding Rule.*

## RULE.

As the gauge-point 1.11 on A, is to unity on B; so is the warm gallons on A, to the cold gallons on B.

*Note.* The gauge-point 1.11, is found by dividing unity by nine-tenths.

$$\begin{array}{ccccccc}
 \text{On A.} & & \text{On B.} & & \text{On A.} & & \text{On B.} \\
 \text{As 1.11} & : & 1 & :: & 184.8 & : & 166.5 \text{ ale gallons.}
 \end{array}$$

2. Suppose a gauge of warm wort, in a cooler, to be 225.6 gallons; upon how many gallons must the duty be charged?  
*Ans.* 203 gallons.

## CASE II.

*When the area of a fixed utensil, and the depth of the liquor are known, but not the number of warm gallons.*

## RULE.

*By the Pen.*

Multiply the area by the depth; divide the product by 1.11; and the quotient will be the number of cold gallons.

*Note.* Here it may be observed that the area multiplied by the depth evidently gives the number of warm gallons; hence the number of cold gallons may be obtained by case the first; the last Rule, however, is well adapted to the Sliding Rule.

## EXAMPLES.

1. If the area of a cooler be 23.25 gallons, and the depth of the warm wort 5.6 inches; for how many gallons must the victualler be charged?

*Ale Gallons.*

23.25 area.

5.6 depth.

$$\begin{array}{r}
 13950 \\
 11625 \\
 \hline
 \text{Divisor } 1.11 \overline{)180.200} (117.29 \text{ Ans.} \\

 \underline{777} \\
 330 \\
 \underline{222} \\
 1080 \\
 \underline{999} \\
 81 \\
 \hline
 \hline
 \end{array}$$

*By the Sliding Rule.*

As the divisor 1.11 on A, is to the area on B; so is the depth on A, to the answer on B.

On A.    On B.    On A.    On B.  
*As* 1.11 : 23.25 :: 5.6 : 117.5 *Ans.*

*Note.* A brass pin should be put upon the line A, at the gauge-point 1.11, for the convenience of casting warm gauges.

2. The area of a cooler is 26.45 gallons, and the depth of the warm wort 6.8 inches; required the number of gallons, when the wort is cold. *Ans.* 162.036 *ale gallons.*

3. The area of the first horizontal section of a guile-tun in the form of the frustum of a cone, is 4.9 ale gallons, and the corresponding depth of warm wort 8 inches; the area of the second section, is 5.25 ale gallons, and its corresponding depth 7.4 inches; how many gal-

lons will the vessel contain, when the heat has evaporated?  
*Ans.* 70.315 ale gallons.

### CASE III.

*When the warm wort is in a circular by-tub.*

*By the Sliding Rule.*

#### RULE.

As the warm gauge-point 20 on D, is to the depth of the liquor on C; so is the mean diameter on D, to the net gallons on C.

*Note 1.* If the square of the diameter of a cylindrical vessel, be multiplied by the depth of the warm wort, and the product divided by 400; the quotient will be the number of gallons, when the wort is cold; hence the warm circular gauge-point, given in the last Rule, is found by extracting the square root of 400, the warm circular divisor.

2. If the length of a rectangular cooler be multiplied by its breadth, and this product by the depth of the warm wort; the quotient arising from dividing the last product by 313.33, will be the number of gallons, when the wort is cold; hence, if we extract the square root of this warm square divisor, we obtain 17.7, the warm square gauge-point.

3. The warm square divisor 313.33, is found by dividing 288 by .9; and the warm circular divisor 400, is obtained by dividing 359.05 by .9; the last quotient, however, is only 398.944; but for expedition, in practice, it may be called 400.

#### EXAMPLES.

1. If the mean diameter of a circular by-tub be 36.4 inches, and the depth of the warm wort 14.8 inches; to what number of gallons will the wort gauge, when it is cold?

*By the Sliding Rule.*

On D.	On C.	On D.	On C.
As 20	: 14.8	:: 36.4	: 49 ale gallons.

2. The mean diameter of a circular by-tub is 27.8 inches, and the depth of the warm wort 23.6 inches; required the number of gallons, when the wort is cold?

*Ans.* 45.6 ale gallons.

## REMARK.

In charging the duty upon ale and beer, when the decimal parts of a gallon are less than .25, they are rejected; but if .25 and under .75, they are called half a gallon; and when .75 or above, they are called a whole gallon.

## PROBLEM XIV.

*Given the top and bottom diameters, and the perpendicular depth of a vessel in the form of the frustum of a cone, to determine the intermediate diameters, at any assigned depth.*

## RULE.

Divide the difference between the top and bottom diameters by the perpendicular depth of the vessel; multiply the assigned depth by the quotient; add the product to the less diameter; and the sum will be the diameter at the assigned depth, if that depth be measured from the less base. But if the depth be taken from the greater base, then subtract the said product from the greater diameter; and the remainder will be the diameter required.

## EXAMPLES.

1. If the top diameter of a vessel in the form of the frustum of a cone be 40 inches, the bottom diameter 30 inches, and the perpendicular depth 28 inches; required the intermediate diameters, at every 4 inches of its perpendicular depth, measured from the less base?

Here  $\frac{40 - 30}{28} = \frac{10}{28} = .357$ , the common factor or multiplier; then  $4 \times .357 + 30 = 1.428 + 30 = 31.428$  the diameter at 4 inches from the bottom;  $8 \times .357 + 30 = 2.856 + 30 = 32.856$ , the diameter at 8 inches from the bottom;  $12 \times .357 + 30 = 4.284 + 30 = 34.284$ , the diameter at 12 inches from the bottom;  $16 \times .357 + 30 = 5.712 + 30 = 35.712$ , the diameter at 16 inches from the bottom,  $20 \times .357 + 30 = 7.140 + 30 = 37.140$ , the diameter at 20 inches from the bot-

*m*; and  $24 \times .357 + 30 = 8.568 + 30 = 38.568$  the diameter at 24 inches from the bottom.

2. The top diameter of a vessel in the form of the frustum of a cone, measures 42 inches, the bottom diameter 58 inches, and the perpendicular depth 35 inches; it is required to determine the intermediate diameters at every 5 inches of its depth, measured from the greater base.

*Ans.* The diameter at 5 inches from the bottom, is 55.715; at 10 inches, 53.430; at 15 inches, 51.145; at 20 inches, 48.860; at 25 inches, 46.570; and at 30 inches, 44.290 inches.

#### REMARK.

The last Problem may be well applied in gauging and measuring a Common Brewer's large guile-tun, in the form of the frustum of a cone; for if we take cross diameters at the top of the vessel, and at every ten inches of the perpendicular depth; and from these cross diameters find mean diameters; we may then determine the intermediate diameters, between every 10 inches, with the greatest accuracy; and consequently, *inch* the guile-tun with the utmost correctness, by finding the area corresponding to each diameter, either by the Pen, the Sliding Rule, or the Table of Ale Areas.

Or, when diameters are taken in the middle of every 10 inches, the Rule may be well applied as a check, in the following manner: Measure the top and bottom diameters, and also the perpendicular depth; and then determine the intermediate diameters in the middle of every 10 inches; and if they correspond with those found by measurement, it is evident that the vessel is the true frustum of a cone, and that all the operations have been performed with accuracy.

#### PROBLEM XV.

*Given the top and bottom diameters, and the perpendicular depth of a vessel in the form of the frustum of a semi-sphere, to determine the intermediate diameter, at any assigned depth from the top of the vessel.*

*To find the diameter of the sphere of which the frustum is a part.*

### RULE I.

From the square of half the greater diameter of the frustum, subtract the sum of the squares of half the less diameter and the perpendicular depth; divide the remainder by twice the said depth; and the quotient will be the distance of the greater diameter from the centre of the sphere. To the square of this distance add the square of half the greater diameter; multiply the square root of the sum by two, and the product will be the diameter of the sphere.

*Note.* When the greater diameter of the frustum is equal to the diameter of the sphere, the square of half the greater diameter of the frustum will be equal to the sum of the squares of half the less diameter and the perpendicular depth; hence we may always know when the greater diameter of the frustum passes through the centre of the sphere. (See the following Figure.)

*To find the height of the spherical segment cut off by the less diameter of the frustum.*

### RULE II.

From half the diameter of the sphere subtract the distance between its centre and the less diameter of the frustum; and the remainder will be the height of the segment.

*Note.* When the greater diameter of the frustum is equal to the diameter of the sphere; the height of the segment must be found by subtracting the height of the frustum from half its greater diameter.

*To find the diameter at any assigned depth from the top of the frustum.*

### RULE III.

To the altitude of the segment cut off by the top diameter, add the assigned depth of the frustum; subtract the sum from the diameter of the sphere; multiply the remainder by the said sum; and twice the square root of the product will be the diameter required.

In this manner proceed until you have found the diameters at every inch of the depth, if necessary.

*Note.* When it is required to find the intermediate diameters at every inch of the perpendicular depth of the frustum, 1 inch will be the first assigned depth, 2 inches the second, 3 inches the third, &c. &c.; which numbers must be added successively to the height of the segment.

#### EXAMPLES.

1. The greater diameter of a vessel, in the form of the frustum of a semi-sphere, is 98.4, the less diameter 60.6, and the perpendicular depth 30.2 inches; required the intermediate diameters at every inch of the first 5 inches of the perpendicular depth from the top of the vessel.

#### TO FIND THE DIAMETER OF THE SPHERE.

Let  $KHL$  denote the middle section of the semi-sphere, and  $ABCD$  that of the given vessel; then by the question, we have the greater diameter  $AB = 98.4$ , the less diameter  $DC = 60.6$ , and the perpendicular depth  $FG = 30.2$ .

By Rule I., we have,  $49.2^2 = 2420.64$ , the square of half the greater diameter; and  $30.3^2 + 30.2^2 = 918.09 + 912.04 = 1830.13$ , the sum of the squares of half the less diameter

E e

and the perpendicular depth ; then  $\frac{2420.64 - 1830.13}{30.2 \times 2} =$

$\frac{590.51}{60.4} = 9.77$  inches  $= E F$ , the distance of the greater dia-

meter of the frustum from the centre of the sphere.

Again,  $9.77^2 + 49.2^2 = 95.4529 + 2420.64 = 2516.0929$  ;  
and  $2\sqrt{2516.0929} = 50.16 \times 2 = 100.32$  inches,  $= K L$  or  
 $H P$ , the diameter of the sphere.

#### TO FIND THE HEIGHT OF THE SPHERICAL SEGMENT.

Here  $30.2 + 9.77 = 39.97$  inches  $= E G$ , the distance between the centre of the sphere and the less diameter of the frustum ; then, by Rule II., we have  $50.16 - 39.97 = 10.19$  inches  $= G H$ , the height of the segment  $D H C$ .

#### TO FIND THE INTERMEDIATE DIAMETERS.

By Rule III., we have  $10.19 + 1 = 11.19$ , the altitude of the segment added to the assigned depth ; then,  $100.32 - 11.19 \times 11.19 = 89.13 \times 11.19 = 997.3647$  ; and  $2\sqrt{997.3647} = 31.58 \times 2 = 63.16$  inches, the diameter at 1 inch from the top of the given vessel.

Again,  $10.19 + 2 = 12.19$ , the altitude of the segment added to the assigned depth ; then  $100.32 - 12.19 \times 12.19 = 88.13 \times 12.19 = 1074.3047$  ; and  $2\sqrt{1074.3047} = 32.77 \times 2 = 65.54$  inches, the diameter at 2 inches from the top of the vessel.

By a similar process, we find 67.88 inches to be the diameter at 3 inches ; 69.90 inches, at 4 inches ; and 71.92 inches, at 5 inches from the top of the given vessel.

*Note.* By proceeding in the same manner, any diameter of the frustum  $M N C D$ , or of the segment  $D P C$ , may be easily obtained.

2. The top diameter of a vessel, in the form of the frustum of a semi-sphere, is 24 inches, the bottom diameter 36 inches, and the perpendicular depth 8 inches ; required the intermediate diameters, at every inch of the perpendicular depth, from the top of the vessel.

*Ans.* The first intermediate diameter is 26.32, the second 28.34, the third 30.08, the fourth 31.60, the fifth 32.94, the sixth 34.101, and the seventh 35.10 inches.

3. The top diameter of the upper part of a still, in the form of the frustum of a semi-sphere, is 28 inches, the bottom diameter 55.6 inches; and the perpendicular depth 12 inches; required the intermediate diameters, at every inch of the perpendicular depth, from the top of the frustum.

*Ans.* The first intermediate diameter is 31.92, the second 35.32, the third 38.30, the fourth 40.98, the fifth 43.40, the sixth 45.60, the seventh 47.62, the eighth 49.48, the ninth 51.18, the tenth 52.76, and the eleventh 54.22 inches.

### GENERAL RULES.

1. *Given the top and bottom diameters, and the perpendicular depth of a vessel in the form of the frustum of a semi-sphere, to determine the intermediate diameter, at any assigned depth from the bottom of the vessel.*

#### RULE.

*(See the last figure.)*

Find the diameter  $HP$  of the sphere, and the versed sine  $FH$  of the less segment  $AHB$ , as directed in the last Problem; then from the diameter of the sphere subtract the versed sine of the less segment; and the difference will be the versed sine  $FP$  of the greater segment  $APB$ .

To the versed sine of the greater segment add the assigned depth, and from the versed sine of the less segment subtract the said depth; multiply the sum by the remainder; and twice the square root of the product will be the diameter of the vessel, at the assigned depth from the bottom diameter  $AB$ .

2. *Given the top diameter and perpendicular depth of a vessel in the form of the less segment of a sphere, to determine the intermediate diameter at any assigned depth from the top of the vessel.*

## RULE.

*(See the last figure.)*

Divide the square of half the top diameter  $M N$ , by the versed sine or perpendicular depth  $R P$ , of the less segment  $M P N$ ; and the quotient will be the versed sine  $R H$ , of the greater segment  $M H N$ .

To the versed sine of the greater segment add the assigned depth, and from the versed sine of the less segment subtract the said depth; multiply the sum by the remainder; and twice the square root of the product will be the diameter of the vessel, at the assigned depth from the top diameter  $M N$ .

3. *Given the top diameter and perpendicular depth of a vessel in the form of the less segment of a sphere, to determine the intermediate diameter, at any assigned depth from the bottom of the vessel.*

## RULE.

*(See the last figure.)*

Divide the square of half the top diameter by the perpendicular depth; to the quotient add the said depth; and the sum will be the diameter of the sphere.

From the diameter of the sphere subtract the assigned depth from the bottom of the segment; multiply the remainder by the said depth; and twice the square root of the product will be the diameter required.

*Note.* The diameter at any part of a vessel in the form of a sphere or globe, may be found by the last Rule.

## REMARK.

The last Problem may be well applied in *gauging* and *inching* any vessel either in the form of a sphere, or of the frustum or segment of a sphere; for having determined the diameters at every inch of the perpendicular depth, we may hence find the area corresponding to each diameter, either by the Pen, the Sliding Rule, or the Tables of Ale and Wine Areas, in Part VII.

REMARKS.

The foregoing method of entering the dimensions and areas of Victualler's Utensils, in the Officer's Dimension Book, is the same that is practised in the Excise. The first column contains the dimensions and area of the Round Mash Tun, given in the first Problem of this Section. At the top is placed the depth ; under it the diameter ; and at the bottom the area. The second column contains

the dimensions and area of the Square Mash Tun, given in the second Problem. In the third column we have the depth and diameters of the Copper; and in the fourth column, the areas corresponding to those diameters, as found in the third Problem.

The fifth column contains the dimensions and area of the Underback; the sixth contains the length, breadth, and area of the first Back or Cooler; and in the seventh and eighth columns are placed the dimensions and areas of the first Round Guile-Tun.

The second part of the Table contains the dimensions and areas of the second and third Rounds; and of the first and second Squares. The dimensions and areas of the fourth Round, are not inserted; because the method of entering them is precisely the same as that of the third Round.

The third part of the Table, contains the dimensions and area of the second Back or Cooler, gauged and fixed by *equi-distant ordinates*. This is the seventh Example in the twentieth Problem of Part IV.; and agreeably to an observation made in a Note, at the end of the fifth Problem of this Section, it is considered as the base of a Victualler's Cooler,

*Note.* When the bottom of a Cooler is a triangle, the base and half the perpendicular may be entered in the Officer's Dimension Book; when it is a trapezium, the diagonal and half the sum of the two perpendiculars may be entered; and when an irregular polygon of several sides, many experienced Officers make a small sketch of the figure, at the top of the Dimension Book; and enter the dimensions upon the respective parts of the figure, and the area below it. (See Examples and Notes in Problems IV., V., VI., VII., and VIII., Part IV.; and also Problem VII., Section II., Part VI.)

## SECTION II.

THE METHOD OF GAUGING AND INCHING COMMON  
BREWERS' UTENSILS, AS PRACTISED IN THE EXCISE.

---

## PROBLEM I.

*To gauge and inch a mash-tun in the form of the frustum  
of a cone, standing upon its greater base.*

*To take the dimensions.*

With any convenient instrument, measure the perpendicular depth of the tun. Then quarter it as directed in Problem III., Sect. I.; and take cross diameters in the middle of every ten inches, from the bottom upwards, if you intend to *table* the tun for *wet* inches; but from the top downwards, when the tun is to be *tabled* for *dry* inches; so will the odd inches fall at the top of the vessel in the first case, and at the bottom in the second. From the cross diameters find mean diameters; and enter all the dimensions in your Note Book,

*To find the area and content.*

## RULE.

Divide the square of each mean diameter by 289; and the quotients will be the areas of the respective sections, in mash-tun gallons. Multiply these areas by their corresponding depths; and the sum of the products will be the whole content of the tun.

*Note.* As 8 gallons make one bushel, and 8 bushels one quarter, any area or content in gallons, may be reduced to bushels by dividing it by 8; and if the quotient thus found, be divided by 8 also, we shall obtain the area or content in quarters. The same numbers must also be used in Addition and Subtraction of quarters, bushels, and gallons.

## EXAMPLES.

1. Let the following figure A B C D represent a common brewer's mash-tun in the form of the frustum of a cone standing upon its greater base; it is required to *gauge* and *inch* it, as practised in the Excise.

Measure the perpendicular depth of the tun; then quarter it, and take cross diameters, from which find mean diameters, as before directed; and enter all the dimensions in your Note Book, as below.

## NOTE BOOK.

<i>A.B.'s Round Mash Tun, No.1, gauged July 20, 1821.</i>					
Divisions in Inches.	Depth from the Bottom.	Cross Diameters.		Sum of Ditto.	Mean Dia- meters.
10	45	61.9	61.7	123.6	61.8
10	35	63.8	63.6	127.4	63.7
10	25	66.4	65.6	132.0	66.0
10	15	68.4	68.8	137.2	68.6
10	5	71.3	71.1	142.4	71.2

BY THE PEN.

To find the area and content.

Inches. Inches. Divisor. M. T. Gallons.

71.2 x 71.2 ÷ 289 = 17.541 area of the 1st section.

68.6 x 68.6 ÷ 289 = 16.283 area of the 2nd section.

66.0 x 66.0 ÷ 289 = 15.072 area of the 3rd section.

63.7 x 63.7 ÷ 289 = 14.040 area of the 4th section.

61.8 x 61.8 ÷ 289 = 13.215 area of the 5th section.

8)761.51 whole content.

8)95 bu. 1.51 gallons.

11 qr. 7 bu. 1.51 gallons.

Note 1. In adding the areas together, the decimal point is removed one place towards the right; hence we obtain the whole content of the tun, in gallons. We then divide twice by 8, in order to reduce the content into quarters, bushels, and gallons. We also obtain the content of every 10 inches of the perpendicular depth, by removing the decimal point one place towards the right, in each area.

2. The areas of the horizontal sections may be found by the Sliding Rule, as directed in the last Section.

DIMENSION BOOK.

From the Note Book, and from the foregoing areas and contents, we form the Dimension Book, as below.

A. B.'s Round Mash Tun, No. 1, gauged July 20, 1821.

Depths in Inches.	Mean Dia- meters.	Areas in Gallons.	Contents in Gallons.	Areas. in			Contents. in		
				Q.	B.	G.	Q.	B.	G.
10	61.8	13.215	132.15	0	1	5.215	2	0	4.15
10	63.7	14.040	140.40	0	1	6.040	2	1	4.40
10	66.0	15.072	150.72	0	1	7.072	2	2	6.72
10	68.6	16.283	162.83	0	2	0.283	2	4	2.83
10	71.2	17.541	175.41	0	2	1.541	2	5	7.41
50	Whole Depth.	761.51	Whole content.	11	7	1.51			

*To prove the foregoing Table.*

**RULE.**

In order to prevent mistakes, it is necessary to prove the Tabling at every 10 inches of the depth, in the following manner: Compare the content of the first 10 inches, with the corresponding content in the Dimension Book; and if they agree, the work is right. Again, to the content of the first 10 inches, add the content of the second 10 inches; and the sum will be the content of the first 20 inches. To this content add the content of the third 10 inches; and you will obtain the content at 30 inches; &c. &c. as in the following work.

**PROOF.**

Q.	B.	G.	
2	5	7.41	content of the first 10 inches.
2	4	2.83	content of the second 10 inches.
<hr/>			
5	2	2.24	content of the first 20 inches.
2	2	6.72	content of the third 10 inches.
<hr/>			
7	5	0.96	content at 30 inches
2	1	4.40	content of the fourth 10 inches.
<hr/>			
9	6	5.36	content at 40 inches.
2	0	4.15	content of the last 10 inches.
<hr/>			
11	7	1.51	content at 50 inches.
<hr/>			

*Note.* When cross diameters are taken in the middle of every 6, 8, 12, &c. inches; the Tabling must of course be proved at those depths.

*To form the following Table Book.*

**RULE.**

From the foregoing Table, take the numbers corresponding to each inch, and place them successively one after another, in proper columns; and when the first place of decimals is five-tenths or upwards, call it one gallon; but if it be under five-tenths, it must be rejected.

COMMON BREWER'S TABLE BOOK.

3	4	0	26	6	5	5	39	9	4	7								

Suppose the Excise Officer found the depth of the goods, in going mash-tun, to be 32 inches; then, by the above Table the content of this gauge is 9 quarters, 0 bushels, and 4 gallons; this part of gauging is intended for a check upon the Trader, who may expect to find about 24 barrels of liquor, when he has the wort; because, on an average, one quarter of malt is con- sidered to produce about 3 barrels of ale. However, as some Brewers brew their ale stronger than others; and as bad malt generally contains more grains and less wort than good; much dependence cannot be placed on mash-tun gauges.

EXAM. 2.

The perpendicular depth of a mash-tun in the form of a frustum of a cone, standing upon its greater base, is 46 inches; the mean diameter taken at 5 inches from the top, is 90.4; at 15 inches, 88.2; at 25 inches, 86.1; at 35 inches, 83.8; and 46 inches from the bottom, the diameter is 81.6 inches; it is required to find the content of each section, the content of each division, and to find the content of the whole tun as practised in the Excise.

## ANSWER.

<i>Areas.</i>	<i>Contents.</i>
<i>Mash-tun gallons.</i>	<i>Mash-tun gallons.</i>
28.277 <i>first section</i> .....	282.77 <i>first division.</i>
26.917 <i>second section</i> .....	269.17 <i>second division.</i>
25.651 <i>third section</i> .....	256.51 <i>third division.</i>
24.299 <i>fourth section</i> .....	242.99 <i>fourth division.</i>
23.140 <i>fifth section</i> .....	276.48 <i>fifth division.</i>
<i>Whole content</i> ..... <u>1327 92</u> <i>sum.</i>	

*Note.* In the above answer, only the areas of the sections, and the contents of the divisions are inserted; but in the Key to this Work, a Dimension Book is formed, and the content of the vessel is given at every inch of its perpendicular depth, as required in the Question.

## REMARK.

A mash-tun in the form of a parallelopipedon, or a cylinder, may be *inched* by finding the area of its base, and proceeding with this area according to the foregoing directions; and if a mash-tun be the frustum of a pyramid, or a prismoid, take mean dimensions in the middle of every ten inches, find the areas of the different sections, with which proceed as directed in the last Problem.

## PROBLEM II.

*To gauge and inch a copper with a rising crown.*

## PRELIMINARY OBSERVATIONS.

Coppers used by Common Brewers, have generally bottoms somewhat resembling the segment of a sphere. When the convex part projects upwards, the copper is said to have a *rising crown*; but when it projects downwards, leaving a concave space within, it is denominated a *falling crown*. Coppers with horizontal bottoms are seldom met with; and it may also be remarked that small coppers have generally falling crowns; while those of pretty large dimensions, are commonly made with rising crowns. To the mouth of some coppers is attached a copper-hoop, called a *curb*. The curb rises several inches

above the top of the copper; and is generally of a considerably greater diameter; consequently, it is necessary to take its dimensions as a distinct part of the copper.

## EXAMPLES.

## EXAM. I.

Let the following figure A B C D represent a common brewer's copper with a rising crown; it is required to size and sink it, as practised in the Exercise.

*To take the dimensions.*

Lay a straight pole or rod diametrically across the top of the copper; and mark it with chalk, where it is intersected by the sides, as at A and B. Also, mark the middle of the line A B, as at F; measure the distance from F to the centre of the crown at H; and you will have the perpendicular depth of the copper = 57.8 inches. Let fall a plumb-line from the diameter A B, to the middle of the bottom at D; and mark A B, where the plumb-line and diameter intersect each other, as at E. Measure the depth E D = 65 inches; then  $E D - F H = 65 - 57.8 = 7.2$  inches, the height of the crown or spherical segment of the bottom.

Again, let fall the plumb-line to C; mark A B at G;

F f 2

and  $E G$  will be  $= C D = 54$  inches, the diameter of the spherical segment of the bottom.

Set off 7.2 inches, the height of the crown, perpendicularly from  $D$  to  $x$ ; and by repeating the process, make a sufficient number of marks upon the sides of the copper, so that through these marks a circle may be drawn by the hand, round the inside of the copper, on a level with the top of its crown; that is, at the perpendicular distance of 57.8 inches from the diameter  $A B$ , at the copper's mouth.

Measure the diameter  $A B = 80$  inches, and also the diameter  $x x$ , at the top of the crown  $= 63$  inches; then quarter the top of the copper, and likewise the circle at the crown, as directed in Prob. III., Sect. I. Draw four lines down the inside of the copper, from the angular points at the top to the corresponding points in the circle at the crown; and the copper will be truly quartered in every part of its depth.

Next, make a mark upon a straight rod, at the distance of 65 inches from one end,  $= E D$ ; and at 4, 13, 23, 33, 42, 49, and 54.9 inches from  $E$ , make marks upon the same rod; then place the bottom of the rod in the angle of the copper at  $D$ ; transfer those distances perpendicularly to one of the quartering lines, on the side of the copper, as directed in Prob. III., Sect. I.; and you will obtain the points  $a, b, c, d, e, m$ , and  $n$ . Transfer the same distances to the other three quartering lines; and you will have all the points, on the quartering lines, at which cross diameters must be taken.

Lastly, measure the cross diameters, from which find mean diameters; and enter all the dimensions in your Note Book, as follows,

# NOTE BOOK.

*A. B.'s Copper No. 1, gauged July 20, 1821.*

Divisions in Inches.	Depths from the Top.	Cross Diameters.		Sum of Ditto.	Mean Diameters.	
8	4	81.4	81.2	162.6	81.3	aa
10	12	82.2	82.6	164.8	82.4	bb
10	23	82.6	82.0	164.6	82.3	cc
10	33	82.1	82.3	164.4	82.2	dd
8	42	76.5	76.3	152.8	76.4	ee
6	49	72.6	72.8	145.4	72.7	ff
5.8	54.9	68.2	68.4	136.6	68.3	gg
	57.8	63.3	63.1	126.4	63.2	hh
Height of the crown.				7.2	54.0	CD

*Note I.* A common Brewer's copper is generally *tabled* for dry  
uses; consequently, the cross diameters must be taken from the top  
inwards, in order that the odd inches and tenths may fall at the  
bottom of the copper. When it is intended to *table* a copper for wet  
uses, then the diameters must be taken from the bottom towards the  
top of the vessel. (See Prob. III.)

When the copper is large, a lighted candle may be placed upon the  
center of its crown, and the day-light excluded from above, by  
bringing the top of the copper; then, if a plumb-line be held suc-  
cessively between the candle and each of the quartering points at the  
bottom, the quartering lines may easily be traced down the sides of the  
copper by means of the shadow produced by the candle and the

The quartering points at the bottom may also be found without  
help of a candle; for if the rod A B, be laid upon two of the  
top quartering points at the top, and a plummet suspended from  
it, as to come in contact with the side of the copper, on a level with  
the top of the crown, we shall thus obtain the quartering point at x,  
which corresponds with that at A. In like manner the other three  
quartering points at the bottom may be obtained. Hence the copper  
may be quartered without drawing a circle round the inside, upon a  
level with the top of the crown.

*To find the area and content.*

## RULE.

Find the area corresponding to each mean diameter, in  
Table of *Ale Areas*, Part VII., then multiply each area

by its respective depth; and the sum of the products be the whole content of the copper.

*To find the quantity of liquor that will cover the crown*

### RULE I.

By Prob VIII., Part V., find the content of the frustum  $CDxx$ ; also, by Prob. XI., of the same Part, find the content of the segment  $CHD$ ; and the difference of these contents will be the quantity of liquor required.

*Note.* As the altitude of the frustum  $CDxx$ , is small, it may be reduced to a cylinder by finding a mean diameter; and then its content may easily be obtained by Prob. IV., Part V.

### RULE II.

From the Table of Ale Areas, take the area corresponding to the diameter  $xx$ , at the top of the crown; and also that corresponding to the number which expresses the height of the crown; then from the first area subtract  $1\frac{1}{2}$  of the latter area; multiply the remainder by half the height of the crown; and the product will be the number of gallons required.

### RULE III.

Pour into the copper as much water as will just cover the crown; then draw off the water into a vessel of a known measure, or into one that may be easily gauged; and you will obtain the exact number of gallons required.

*Note 1.* A circle may be easily traced, at the surface of the water, with chalk, before the water is drawn off, if the copper be not very large; and this circle may then be quartered as before directed. (See the method of taking the dimensions.)

2. It is unnecessary, to measure the diameters  $CD$  and  $xx$ , or the height of the crown; when the quantity of liquor that will cover it, is ascertained by the last Rule.

3. The two first Rules will always give nearly the true quantity of liquor that will cover the crown, when it is the segment of a sphere: but as it cannot be easily determined what figure the crown of a copper assumes, the third Rule is always preferred in Practice.

Operation of finding the quantity of liquor to cover the crown.

By Rule II.

	Inches.	Ale gallons.
Diameter $\pi \pi$	= 63.2 .....	11.1596 area.
Height of the crown	= 7.2 .....	.1444 } area.
		.0481 } $\frac{1}{2}$ ditto.
		.1925 sum.
		10.9671 difference.
Half the height of the crown .....		3.6 inches.
		658026
		339013
Liquor to cover the crown.....		<u>40.48156</u> product.

Note 1. By the first Rule, the quantity of liquor necessary to cover the crown, is found to be 39.1 gallons; but by covering the crown with water, as directed in the third Rule, the quantity is found to be 40.48 gallons.

2. As 9 gallons make one firkin, and 4 firkins one barrel, any area or content in gallons may be reduced to firkins by dividing it by 9; and the quotient thus found be divided by 4, we shall obtain the area or content in barrels. The same numbers must also be used in Addition and Subtraction of barrels, firkins, and gallons. (See Table II. Part IV.)

# DIMENSION BOOK.

Having found the areas of the several sections, and the contents of the different divisions, as before directed; we hence form the Dimension Book, as follows.

A. B.'s Copper, No. 1, gauged July 20, 1821.									
Depths in Inches.	Mean Dia- meters.	Areas in Gallons.	Contents in Gallons.	Areas in		Contents in			
				B.	F.	G.	B.	F.	G.
8	81.3	18.409	147.872	0	2	0.409	4	0	3.272
10	82.4	18.910	189.100	0	2	0.910	5	1	0.100
10	82.8	19.094	190.940	0	2	1.094	5	1	1.940
10	82.2	18.818	188.180	0	2	0.818	5	0	8.180
8	76.4	16.256	130.048	0	1	7.256	3	2	4.048
6	72.7	14.720	88.320	0	1	5.720	2	1	7.320
5.8	68.3	12.992	75.354	0	1	3.992	2	0	3.354
57.8	Depth	Crown	38.000	Per Measure			1	0	2.000
Whole Content			1047.214	Whole Content			29	0	3.214

*Note.* The contents in the fourth column, were found by multiplying the areas in the third column, by their respective depths in the first column.

*To find the content of the foregoing copper, at every dry inch of its perpendicular depth.*

### RULE.

From the whole content, reduced to barrels, firkins, and gallons, subtract the area of the first section; and the remainder will be the content, when one inch is dry. From this remainder subtract the same area, and you will obtain the content when two inches are dry. Proceed in this manner until you have *inched* the whole tun; taking care to change the area when you arrive at 8 inches, at 18 inches, &c. of the perpendicular depth from the top of the copper, as in the following Table.

A TABLE SHOWING THE METHOD OF INCHING THE FOREGOING COPPER.

*Note.* The number 1 F. 1.394 G. in the third line from the end of the above Table, is obtained by taking  $\frac{8}{10}$  of 1 F. 3.992 G., the area of the seventh section.

*To prove the foregoing Table.*

### RULE.

From the whole content of the copper, subtract the content of the first division, taken from the Dimension Book; and the remainder will be the content at eight inches from the top. From this content take the content of the second division, and the remainder will be the content at eighteen inches from the top, &c. &c. as in the following work.

B.	F.	G.	PROOF.
29	0	8.214	<i>whole content of the copper.</i>
4	0	3.272	<i>content of the first division.</i>
24	8	8.942	<i>content at eight inches from the top.</i>
5	1	0.100	<i>content of the second division.</i>
19	2	8.842	<i>content at eighteen inches from the top.</i>
5	1	1.940	<i>content of the third division.</i>
14	1	6.902	<i>content at twenty-eight inches from the top.</i>
5	0	8.180	<i>content of the fourth division.</i>
9	0	7.722	<i>content at thirty-eight inches from the top.</i>
3	2	4.048	<i>content of the fifth division.</i>

(SECT. II.) COMMON BREWERS' UTENSILS.

215

B. F. G.

5 2 3.674 content at forty-six inches from the top.

2 1 7.320 content of the sixth division.

3 0 5.854 content at fifty-two inches from the top.

2 0 3.854 content of the seventh division.

1 0 2.000 content at the top of the crown.

1 0 2.000 content to cover the crown, per measure.

*Note.* The following Table Book is formed in the same manner as directed in the last Problem.

COMMON BREWER'S TABLE BOOK.

*Note.* The copper may be tabulated for wet inches, by Prob. III., of Section.

EXAM. 2.

Let the following figure A B C D represent a copper h a rising crown, and a curb; it is required to gauge 1 inch it, as practised in the Exercise.

*Directions, for taking the dimensions, &c.*

Take the dimensions precisely as directed in the last Example; only observing to measure the first pair of cross diameters exactly in the middle of the curb, if its depth be an integral number of inches. If, however, the depth of the curb consists of inches and tenths, the tenths must be considered as belonging to the second division, and must be measured as part of its perpendicular depth; consequently, the odd tenths that may be in the whole depth of the copper, will fall at the bottom, as they always should, when we intend to *table* for dry inches.

Having taken the diameters; found the areas of the several sections; the contents of the different divisions; and the quantity of liquor to cover the crown; we hence form the Dimension Book, as below.

### DIMENSION BOOK.

A. B.'s Copper, No. 2. gauged July 20, 1821.							
Divisions in Inches.	Depths from the top.	Mean Dia. in inches.	Areas in Gallons.	Depths of the Divi- sions.	Contents in Gallons.	Areas in B.F. G.	Contents in B.F. G.
11	5.5	87.6	21.3722	× 11 =	235.0942	0 2 3.3722	6 2 1.0942
10	16	79.4	17.5583	× 10 =	175.5830	0 1 8.5583	4 3 4.5830
10	26	73.5	15.0458	× 10 =	150.4580	0 1 6.0458	4 0 6.4580
8	35	65.2	11.8396	× 8 =	94.7168	0 1 2.8396	2 2 4.7168
8	43	57.8	9.3046	× 8 =	74.4368	0 1 0.3046	2 0 2.4368
6.6	50.8	52.7	7.7350	× 6.6 =	51.0510	0 0 7.7350	1 1 6.0510
53.6	Depth.	Crown per measure.			18.7500	.....	0 2 0.7500
Whole content of the copper.					800.0898	.....	22 0 8.0898

By way of practice, the Learner is required to *tabulate* the foregoing copper, for *dry* inches. (See the Key to this Work, where the content is given at every inch from the top to the bottom of the copper.)

*Note 1.* The depth of the curb is 11.6 inches; consequently, the first mean diameter is taken at 5.5 from the top; namely, in the middle of the eleven inches; and the six-tenths are considered as belonging to the second division of the copper.

2. When the depth of a curb exceeds 10 or 12 integral inches, it will sometimes be necessary, for the sake of accuracy, to divide it into two or more divisions, by measuring mean diameters in the middle of every 6, 7, 8, or 9 inches, as the case may require.

### PROBLEM III.

*To gauge and inch a copper with a falling crown.*

#### EXAMPLE.

Let the following figure *A B C D*, represent a copper with a falling crown; it is required to *gauge and inch* it, as practised in the Excise.

*To take the dimensions, &c.*

By the help of a plumb-line find the depth *E D* or *G C*, from the diameter *A B*, to the angle where the body of  
G g

the copper and its bottom are united; and you will have the perpendicular depth of that part of the copper which is to be *tabulated*.

By the same method determine the depth F H, from the middle of the diameter A B, to the centre of the crown; then F H minus E D = H n, the depth of the crown C H D.

Next, measure the diameters A B and C D, by the help of which quarter the copper. Also take cross diameters, from which find mean diameters; and enter the dimensions, areas, &c. in your Dimension Book, as below.

### DIMENSION BOOK.

<i>A. B.'s Copper, No. 3, gauged Aug. 16, 1821.</i>							
Divisions in Inches.	Depths from the Bottom.	Mean Dia- meters.	Areas in Gal- lons.	Contents in Gallons.	Areas in B. F. G.		Contents in B. F. G.

Whole Depth.	Whole content of the Copper.			774.47	. . .		21 2 0.47

*To find the content of the foregoing copper, at every wet inch of its perpendicular depth.*

### RULE.

To the content of the crown, reduced to barrels, firkins, and gallons, add the area of the first section; and the sum will be the content at one inch deep. To this content add the same area, and you will obtain the content at 2 inches deep, &c. &c. as in the following Table.

## A TABLE

SHOWING THE METHOD OF INCHING THE FOREGOING  
COPPER.

Wet Inches.	Contents in B.F. G.		Wet In- ches.	Contents in B.F. G.		Wet In- ches.	Contents in B.F. G.	
Crown	10	4.110	4	21	5.170	8	32	6.230
	01	2.515		01	2.515		01	2.515
1	11	6.625	5	22	7.685	9	33	8.745
	01	2.515		01	2.515		01	2.515
2	13	0.140	6	30	1.200	10	41	2.260
	01	2.515		01	2.515	*	01	4.882
3	20	2.655	7	31	3.715	11	42	7.142
	01	2.515		01	2.515		01	4.882

In this manner the content may be obtained at every inch of the depth ; and the Learner is required to continue the above process, and form a Table Book.

*Note 1.* The crown of the foregoing copper is considered as the segment of a sphere. The content by Rule I., Prob. XI., Part V., is found in the Key ; in which Work the copper is tabulated for every inch of its depth.

2. In order to prove the process of tabling, add the content of the first division to the content of the crown ; and you will have the content at 10 inches. To this content add the content of the second division ; and the sum will be the content at 20 inches, &c. &c.

## PROBLEM IV.

*To gauge and inch a copper-back.*

## PRELIMINARY OBSERVATIONS.

A copper-back is a vessel, with a flat bottom, fixed horizontally over the top of a copper ; and when several kinds of wort are made at the same brewing, one kind is conveyed into the copper back, while another is boiling in the copper.

By this means the steam which rises from the copper,

G g 2

A TABLE SHEWING THE METHOD OF INCHING THE FOREGOING COPPER-BACK.

Wet In- ches.	Contents in B. F. G.			Wet In- ches.	Contents in B. F. G.			Wet In- ches.	Contents in B. F. G.		
1	1	3	8.878	5	9	3	8.390	9	17	3	7.902
	1	3	8.878		1	3	8.878		1	3	8.878
2	3	8	8.756	6	11	3	8.268	10	19	3	7.780
	1	3	8.878		1	3	8.878		1	3	8.878
3	5	3	8.634	7	13	3	8.146	11	21	3	7.658
	1	3	8.878		1	3	8.878		1	3	8.878
4	7	3	8.512	8	15	3	8.024	12	23	3	7.536
	1	3	8.878		1	3	8.878		1	3	8.878

In this manner the content may be obtained at every *wet* inch; and the Learner is required to continue the above process, and form a Table Book. (See the Key to this Work.)

#### REMARKS.

1. Whatever form a copper-back may assume, its base must be divided into such geometrical figures as may be the most easily measured by the Rules given in the respective Problems of Part IV.

2. If a copper-back be the frustum of a pyramid or cone, dimensions must be taken in the middle of every 10 inches of its perpendicular depth; and it must then be tabulated in the same manner as a guile-tun. (See Problems IX., X., and XI. of this Section.)

#### PROBLEM V.

*To gauge and inch an underback in the form of a cylinder.*

*Directions for taking the dimensions, &c.*

As cylindrical underbacks are seldom perfectly round, cross diameters must be measured in several places; and their sum divided by their number may be taken as a

mean diameter. The square of this mean diameter divided by 359.05, will give the area, (or rather the content) in ale gallons, at one inch deep; and if this content be reduced to barrels, firkins, and gallons, and added to itself, the sum will be the content at two inches deep; and thus, by continual addition, the content of the vessel may be obtained at every wet inch of its depth.

*Note.* The area answering to the mean diameter may also be found in the Table of Ale Areas, in Part VII. ; and if it be multiplied by the mean depth of the vessel, the product will be the content in ale gallons.

#### EXAMPLE.

Let the following figure A B C D, represent a common brewer's cylindrical underback, whose depth is 50 inches, and the cross diameters taken in several places, as below; it is required to tabulate the vessel, for wet inches, as practised in the Excise.

Diameter.	Inches.
<i>First</i> .....	62.6
<i>Second</i> .....	62.5
<i>Third</i> .....	62.4
<i>Fourth</i> .....	63.8
<i>Fifth</i> .....	62.3
<i>Sixth</i> .....	62.6
<i>Divide by</i> .....	6)376.2 <i>sum.</i>
<i>Mean diameter</i> .....	<u>62.7</u> <i>quotient.</i>

*To find the area and content.*

*Here*  $62.7 \times 62.7 \div 359.05 = 3931.29 \div 359.05 = 10.949$   
*ale gallons, = 1 firkin, 1.95 gallons, the mean area; and*  
 $10.95 \times 50 = 547.5$ , *the content in ale gallons.*

## A TABLE

**SHEWING THE METHOD OF INCHING THE FOREGOING UNDERBACK,**

<i>A. B.'s Underback, gauged Aug. 16, 1821.</i>					
Wet In- ches.	Contents in B.F. G.		Wet In- ches.	Contents in B.F. G.	
1	01	1.95	5	12	0.75
	01	1.95		01	1.95
2	02	3.90	6	13	2.70
	01	1.95		01	1.95
3	03	5.85	7	20	4.65
	01	1.95		01	1.95
4	10	7.80	8	21	6.60
	01	1.95		01	1.95
			9	22	8.55
				01	1.95
			10	30	1.50
				01	1.95
			11	31	3.45
				01	1.95
			12	32	5.40

**In this manner the content may be obtained at every inch of the depth; and the Learner is required to continue the above process, and form a Table Book. (See the Key to this Work.)**

c. The process of *tabling* may be proved at every 10 inches, by plying the area in gallons, by 10; and reducing the product to s, firkins, and gallons; then if the content thus found, at 10, be added to itself; the sum will be the content at 20 inches, &c.

### REMARK.

A underback in the form of a parallelopipedon may be *ched* by finding the area of its base, and proceeding with this area as directed in the last Problem; and if an underback be the frustum of a pyramid, or a prismoid, it may be *inched* by finding the areas of a competent number of horizontal sections, and proceeding with these in the same manner as directed for the frustum of a cone in the first Problem of this Section. (See Problems I., IX., X., and XI.)

### PROBLEM VI.

*To gauge and inch a rectangular hop-back.*

A hop-back is a vessel with a false bottom, in which there are a great number of small holes. Into this vessel the wort is received from the copper; and passing through the holes in the false bottom, it is conveyed to the cooler, leaving the hops behind. Sometimes the liquor is retained in the hop-back a considerable time, in order to the convenience of the Brewer. In such a case it may be necessary to take a gauge of the liquor, while in the hop-back; this method, however, is not practised in excise, when it can be avoided, without any danger to the Revenue.

*Directions for taking the dimensions, &c.*

Measure several lengths, and divide their sum by their number for a mean length. Find a mean breadth in the same manner; then multiply the mean length by the mean breadth; divide the product by 288; and the quotient will be the area in ale gallons. Reduce this area to barrels, firkins, and gallons; and then tabulate the result for ~~10~~ inches, as directed in Problems IV. and V.

c. If the area be multiplied by the depth, the product will be the content in ale gallons. (See Remarks at the end of this Problem.)

## EXAMPLE.

The mean length of a rectangular hop-back, is 125.6 inches, the mean breadth 84.7 inches, and the depth 26 inches ; it is required to tabulate the vessel for *wet* inches, as practised in the Excise.

*To find the area and content.*

Here  $125.6 \times 84.7 \div 282 = 10638.32 \div 282 = 37.72$  gallons = 1 barrel, 0 firkins, and 1.72 gallons, the mean area of the vessel ; and  $37.72 \times 26 = 980.72$  gallons = 27 barrels, 0 firkins, and 8.72 gallons, the content.

## DIMENSION BOOK.

	1	0	1.72		1	0	1.72		1	0	1.72

By proceeding in this manner, the content at every *wet* inch may be obtained ; and the Learner is required to continue the process, and form a Table Book. (See the Key to this Work.)

find the depth to be allowed for the hops, false bottom, &c.

### RULE.

Find the content of the liquor, hops, and false bottom, in the hop-back; then draw off the liquor into a cooler, or other vessel; and find the content of the liquor only. Subtract the content of the liquor, hops, and false bottom, from the content of the liquor; and the remainder will be the content of the hops and false bottom. Divide the content, in inches, by the area of the hop-back, in inches; and the quotient will be the deduction that must be made in the depth, when a gauge of wort is taken in the hop-back.

### EXAMPLE.

The length of a hop-back is 114 inches, its breadth 126 inches, and the depth of the liquor 15.5 inches. Now, if wort be drawn off into a cooler whose length measures 152 inches, the breadth 126 inches, and the depth of the liquor 7 inches; what deduction must be made in the depth, when a gauge is taken in the hop-back, in order to make a proper allowance for the hops and false bottom?  
*Ans. 1.5 inches.*

### REMARKS.

The mean depth of the liquor in the hop-back, must be found in the same manner as directed for a cooler; and the different dips cannot be taken with a dipping-rod; a small wire must be used, that will easily pass through the holes in the false bottom.

The constant dipping-place can be only at that end of the hop-back, where the liquor is drawn off into the cooler; and as the back is deeper there than in any other place, in consequence of the inclination of the back, it is evident that a deduction must always be made in the depth, whenever a gauge of wort is taken in the back. Now, if the deduction for hops and false bottom be added to the deduction for drip; the sum will be the whole deduction required, which must be marked on the side of the back, as directed in Problem V., of the last Section.

1. Here it may be necessary to observe, that when a hop-back is fixed and fixed as directed in the last Problem, the deduction for the false bottom will only be correct when the same quantity of liquor is used as was contained in the back when it was fixed. Consequently, when more hops are used, the deduction should be increased;

but when a smaller quantity is employed, the deduction should be diminished in taking the gauge. (For the method of deducting the heat from warm wort, see Problem XII.)

2. When a hop-back is in the form of a cylinder, or the frustum of a pyramid or cone, it must be gauged and inched, in the same manner as an under-back, or a guile-tun. (See Problems V., IX., X., and XI.)

### PROBLEM VII.

*To gauge and tenth a back or cooler.*

*Directions for taking the dimensions, &c.*

Whatever be the form of the cooler, such dimensions must be taken as will give the area of its base, in ale gallons, as directed in Part IV.; and as this area or content is always considered to be one inch deep, it is evident that if we divide it by 10, the quotient will be the area or content at one-tenth of an inch. Reduce this content to barrels, firkins, and gallons, and add it to itself, and the sum will be the content at two-tenths of an inch; and thus by continual addition we may obtain the content of the cooler at every tenth of an inch of its depth.

*Note 1.* When brackets are placed at the corners of the cooler, to strengthen the sides, the sum of their areas must be deducted from the area of the cooler.

2. A constant *dipping-place* may be found as directed in Problem V. of the last Section. (See also the Remark at the end of that Problem.)

#### EXAMPLES.

##### EXAM. 1.

The dimensions of a common brewer's rectangular cooler are given below; it is required to *tenth* it to the depth of three inches, as practised in the Excise.

BY THE PEN.

*To find the area and content.*

*By Prob. 5, Sect. I., Part VI., we have  $220.8 \times 174.3 \div 282 = 38485.44 \div 282 = 136.473$  gallons = 3 barrels, 3 fir-*

, and 1.473 gallons, the area of the cooler ; and 136.473  
 =818.838 gallons=22 barrels, 2 firkins, 8.38 gallons,  
 content of the cooler ; which areas and contents are  
 referred to the *Dimension Book*, as above.

*Note.* The area of the cooler at one inch deep, is 136.473 ale gal-  
 . This being divided by 10, gives 13.6473 ale gallons, the area of  
 cooler, at one-tenth of an inch ; and if this be reduced, we obtain  
 kin and 4.6473 gallons, the numbers to be used in *tenthing* the  
 ar, as in the following Table.

## EXAM. 2.

Let the following figure A B C D E F, represent an irregular cooler, whose depth is 5 inches; it is required to gauge and tenth it, as practised in the Excise.

*Directions for taking the dimensions, &c.*

Produce the line E F to G ; and the cooler will be divided into the two trapeziums A B G F, and E G C D. Measure the diagonals and perpendiculars ; find the double area of each trapezium ; and half the sum of these double areas will be the whole area of the cooler, at one inch deep. Divide this area by 10, and you will have the area at one-tenth of an inch ; then reduce this area to barrels, firkins, and gallons ; and proceed to *tenth* the cooler as shown in the last example. (See Prob. VIII., Part IV.)

*Note.* In the practice of gauging, the dimensions of an irregular figure are most easily entered upon a sketch, as in the last Example. (See Note 2, Exam. 4, of the Problem to which we last referred )

BY THE PEN,

*To find the area.*

By Prob. VIII., Part IV., we have  $(92.7 + 86.2) \times 208.5 = 178.9 \times 208.5 = 37300.65$  double the area of the trapezium A B G F. Again,  $(102.3 + 93.6) \times 223.4 = 195.9 \times 223.4 = 43764.06$  double the area of the trapezium E G C D.

Then, 
$$\frac{37300.65 + 43764.06}{2} = \frac{81064.71}{2} = 40532.355$$

square inches, the area of the whole cooler ; and  $40532.355 \div 282 = 143.731$ , the area in ale gallons, at one inch deep ; consequently, 14.3731 gallons = 1 firkin, and 5.3731 gallons, the area at one-tenth of an inch ; hence, we may proceed to *tenth* the cooler,

*To find the content.*

Here  $143.731 \times 5 = 718.655$  ale gallons = 19 barrels, 3 firkins, and 7.655 gallons, the whole content of the cooler.

PROBLEM VIII.

*Wet-tun in the form of a parallelo-  
pipedon.*

*taking the dimensions, &c.*

Take the dimensions of the vessel; multiply their number for a mean length. In the same manner; then multiply by the mean breadth; divide the product; the quotient will be the area, or rather the content at one inch deep. Multiply by the depth, and the product will be the content of the tun. From this content, re-  
sults, and gallons, subtract the *mean* content; the remainder will be the content at one dry inch. From this content subtract the same area, the remainder will be the content at 2 dry inches, &c. &c. to the bottom of the vessel. (See the copper in Problem II.)

When the area by 10, it is evident that the product is the content of 10 inches of the tun; and if this content be subtracted from the content, the remainder will be the content, hence, the *tabling* may be proved at every

inch, for wet inches, by Prob. IV., of this

EXAMPLE.

A *Wet-tun* in the form of a parallelo-  
pipedon, its length A E 83.4  
inches, its breadth B C 72 inches; it is required to  
find the content, as practised in the Excise.

## DIMENSION BOOK.

The dimensions, area, and content may be entered as below.

<i>A. B.'s Cooler, No. 2, gauged Aug. 16, 1821.</i>										
Depth.	Diagonal- als.	Sum of Perps.	Area in Gallons.	Content in Gallons.	Area in B. F. G.			Content in B. F. G.		
5	208.5	178.9	143.731	718.655	3	3	8.731	19	3	7.655
	223.4	195.9								

*Note.* In the Key to this Work, the Cooler given in the last Example, is *tenths* to its whole depth ; and, by way of practice, the Learner is required to repeat the process, and form a Table-Book, as shown in the first Example.

### REMARK.

Sometimes it is necessary to find a *new* dipping-place, in consequence of the bottom of a cooler becoming very much *warped* with the heat of the wort. In this case, the best method is to pour into the cooler a certain number of gallons of water, so as completely to cover every part of its bottom ; then if these gallons be reduced to inches, and divided by the area of the cooler, in inches, the quotient will be the *true mean* depth of the water that is in the cooler ; hence, by repeated trials you may find a place where the depth of the water exactly corresponds with the *mean* depth found as above directed. Or, you may add or subtract a few tenths, as directed in Prob. V., of the first Section.

### EXAMPLE.

Suppose the area of a Cooler to be 2 barrels, 1 firkin, and 4 gallons ; and admit that 6 barrels of water be poured into the cooler, in order to find a *new* dipping-place ; required the *true mean* depth of the liquor ?

**SOLUTION.** Here  $6 \times 4 \times 9 \times 282 = 24 \times 9 \times 282 = 216 \times 282 = 60912$ , the cubic inches in 6 barrels ; also, 2 barrels, 1 firkin, and 4 gallons = 23970 cubic inches ; then  $60912 \div 23970 = 2.54$  inches, the *true mean* depth required.

*Note.* Of all the methods yet given for finding a true dipping-place, it appears to be the most correct; as it is founded on Mathematical principles.

### PROBLEM VIII.

*gauge and inch a guile-tun in the form of a parallelopipedon.*

*Directions for taking the dimensions, &c.*

Measure several lengths, in different parts of the vessel; divide their sum by their number for a mean length. Find a mean breadth in the same manner; then multiply mean length by the mean breadth; divide the product by 282, and the quotient will be the area, or rather content in ale gallons at one inch deep.

Multiply this area by the depth, and the product will be the whole content of the tun. From this content, reduced to barrels, firkins, and gallons, subtract the mean; and the remainder will be the content at one dry inch. Again, from this content subtract the same area, you will obtain the content at 2 dry inches, &c. &c. till you arrive at the bottom of the vessel. (See the method of inching the copper in Problem II.)

*Note 1.* If we multiply the area by 10, it is evident that the product will be the content of 10 inches of the tun; and if this content be subtracted from the whole content, the remainder will be the content, if 10 inches are dry; hence, the *tabling* may be proved at every inches of the depth.

The tun may be tabulated for wet inches, by Prob. IV., of this book.

#### EXAMPLE.

The length A B of a guile-tun in the form of a parallelopipedon, measures 94.6 inches, its breadth A E 83.4 inches, and its depth B C 72 inches; it is required to rate the tun for dry inches, as practised in the Excise.

BY THE PEN.

*To find the area and content.*

Here  $94.6 \times 83.4 \div 282 = 7889.64 \div 282 = 27.977$  gallons  
 $= 3$  firkins and 0.977 gallons, the mean area; and  $27.977$   
 $\times 72 = 2014.344$  gallons  $= 55$  barrels, 3 firkins, and 7.344  
 gallons, the whole content of the vessel.

0	3	0.977		0	3	0.977		0	3	0.977

In this manner the content may be obtained at every inch ; and the Learner is required to continue the process, and form a Table Book. (See the Key Work.)

1. In taking a gauge of liquor in a Common Brewer's guile-tun the depth is always taken to the nearest half-inch : Thus, if the depth be under 10.3 inches, it is called 10 inches ; if it be 10.3 inches, or under 10.8 inches, it is called 10.5 inches ; and if the depth be 10.8 inches, or above, it is called 11 inches.

When the depth of a gauge contains a *half-inch*, the content is obtained by taking half the sum of the contents corresponding to the two next depths, in whole numbers, one of which is greater and the other less than the depth in question : Thus, if the depth were 10.5 inches, we add 48b. 0f. 7g. the content at 10 inches, taken from the Table, and 47b. 1f. 6g. the content at 11 inches, together ; and obtain 95b. 2f. 4g. Then this sum being divided by 2, gives 47b. 1f. 2g. the content at 10.5 inches. These observations are applicable both to *wet* and *dry* inches.

REMARKS.

Guile Tuns in general go under the common denominations of *Rounds* and *Squares*. Thus, if the base of a guile-tun be a circle or an ellipse, the vessel is called a

Round ; and if the base be a parallelogram, or any other angular figure, the vessel is denominated a Square.

2. Common Brewer's large guile-tuns are generally fixed in an oblique position ; and in such a manner, as to be immoveable. Some are raised on pillars, some are placed upon the floor, and others sunk into the ground. In some brew-houses, however, where small quantities are brēwēd at a time, and consequently large utensils are not required ; they use tuns that can be moved to any part of the brew-house at pleasure.

3. Guile-tuns may be tabulated either for *wet* or *dry* inches ; it is however most convenient, in Practice, to table large tuns for dry, and small tuns for wet inches. By way of illustration, the vessels given in the following Problems, are tabulated for both *wet* and *dry* inches. Thus the Learner will have an opportunity of becoming fully acquainted with both methods. The method of making an allowance for the *fall* or *drip*, occasioned by the inclination of the tun, is also clearly exemplified.

### PROBLEM IX.

*To gauge and inch a guile-tun in the form of the frustum of a cone, and make an allowance for the fall or drip.*

*Directions for finding the content of the drip.*

Large guile-tuns, as before observed, are generally fixed in an inclining position, in order that the liquor may drain off quickly ; and this inclination is called the *fall* or *drip* of the tun ; and the quantity of liquor that is necessary to cover the bottom of the tun, when in this oblique position, is called the content of the drip.

Let A B C D represent the perpendicular section of a guile-tun, in the form of the frustum of a cone standing upon its greater end, in an oblique position ; and if E F be parallel to the bottom of the

vessel, and D E parallel to the horizon; then the quantity of liquor that will just cover the bottom of the vessel, when in this position, will be equal to the content of the conical ungula D C E.

The content of this ungula may easily be obtained by Prob. XXVII., Part V.; and when the vessel is placed upon a less base, the content of the ungula then formed, may be found by Prob. XXVIII, of the same Part; but as the perpendicular height of the ungula seldom exceeds 2 or 3 inches, we may reduce the frustum D C E F to a cylinder, by taking half the sum of the diameters C D and F for a mean diameter; hence the content may be found by Prob. IV., Part V.; half of which may be taken for the content of the *drip*, or ungula D C E.

The most practical method, however, and that which is generally adopted by Officers of the Excise, is to cover the bottom of the vessel with water, from a known measure; and thus the content of the ungula is obtained with the greatest accuracy, whatever may be its form.

*Note 1.* When a vessel in the form of a frustum of a cone, or a conoid, is placed upon its greater end, in an oblique position, it is evident that the content of the ungula D C E is greater than half the content of the frustum D C E F; but if the vessel be placed upon its lesser end, the content of the drip or ungula, will be less than half the content of the frustum of the same base and altitude.

2. If a vessel in the form of a parallelopipedon, or a cylinder, be placed in an oblique position, the content of the ungula will evidently be equal to half the content of the parallelopipedon or cylinder, having the same base and altitude.

### *Directions for taking the dimensions, &c.*

As the line D E is parallel to the horizon, it is evident that when the liquor rises to the top of the vessel at B, the surface will be parallel to D E; and may be represented by the line G B; hence, it appears that the vessel is not full of liquor by the content of the *dry hoof* or ungula A B G.

Having caused water to be poured into the vessel, from a known measure, until its bottom is just covered, then fall a plumb-line from B, to the surface of the water at C; and you will have the perpendicular depth of the

part of the tun which is to be *tabulated*. With the plumb-line, transfer this perpendicular from the surface of the water at *m*, to the side of the vessel at *G*; at which point make a mark; and then measure the diameter *G B*.

Quarter the tun as before directed; and parallel to the diameter *G B*, measure cross diameters in the middle of every 6, 8, or 10 inches, as at *a a*, *b b*, *c c*, &c. &c.; from these cross diameters find mean diameters; then determine the areas of the several sections; and the whole content of the figure *D E B G*, to which add the content of the ungula *D C E*; and the sum will be the quantity of liquor that the vessel will contain, when thus placed in an oblique position.

*Note 1.* When any circular vessel is placed in an inclining position, all the sections that are taken parallel to the horizontal surface of the liquor, required to cover the bottom, will be ellipses; but as the difference of their diameters will always be small, they may be reduced to circles, by taking half the sum of the diameters for a mean diameter. (See Definitions 17, 18, 20, and 21, Part V.)

2. It is scarcely necessary to observe that after the perpendicular depths of *B n*, and *G m* have been determined, the water that was poured into the vessel, to cover its bottom, must be drawn off, before you can, with convenience, measure the cross diameters.

3. The method of tabling the tun for *dry* inches, is shewn in Problem II.; and for *wet* inches, in Problem III, of this Section.

4. When it is intended to table the tun for *wet* inches, cross diameters must be taken in the middle of every 6, 8, or 10 inches from the diameter *D E*, towards the top of the vessel. (See Prob. VI., of the first Section.)

### *Observations on finding a dipping-place.*

As the lines *B n* and *G m*, are both perpendicular to the line *D E*, supposed to be formed by the surface of the liquor required to cover the bottom of the vessel, it is evident that the *dipping-place* may be either at *B* or *G*; but as the perpendicular *G m* is intercepted by the side of the vessel, at *G*; it is obvious that the depth, in either *wet* or *dry* inches, may be most conveniently measured from the top of the tun, in the perpendicular direction of *B n*.

If the tun be *tabulated* for wet inches, the gauging rod, taking the depth, will come in contact with the bottom of the vessel, at  $r$ ; consequently, the depth  $n r$ , of the p, must be ascertained, which let us suppose to be 2 inches; then the number of gallons required to cover the bottom, will be the content at 2 inches deep; and this content added to the area of the first section, will be the content at 3 inches deep; and thus we may obtain the content at every inch of the perpendicular depth  $B n$ .

## EXAMPLES.

## EXAM. 1.

The dimensions of the guile-tun A B C D, in the form of the frustum of a cone, standing upon its greater base, contained in the following Note Book; it is required to tabulate the vessel for *dry* inches, as practised in the foregoing.

	0	3	4.0577		0	3	4.0577		0	3	2.2039

In the same manner the content may be obtained at at every *wet* inch ; and the Learner is required to continue the process, and form a Table Book.

*Note.* As the depth of the *drip* is 2 inches, it is evident that the content of the drip added to the area of the first Section, will be the content of the tun at 3 inches, &c. &c. as in the above Table. (See the observations on finding a dipping-place.)

### PROBLEM X.

*To gauge and inch a circular guile-tun with curved sides, and make an allowance for the drip or fall.*

*Directions for taking the dimensions, &c. &c.*

Pour in water to cover the bottom, as directed in the last Problem ; then quarter the tun, and measure cross diameters in the middle of every 6 or 8 inches. From these cross diameters find mean diameters ; then determine the areas of the several sections, the contents of the different divisions ; and tabulate the vessel, either for *wet* or *dry* inches, as directed in the foregoing Problems. (See Problem VII. of the first Section.)

## EXAMPLES

## EXAM. 1.

Dimensions of the guile-tun A B C D, the areas of radial sections, and the contents of the different, are contained in the following Dimension Book; tried to tabulate the tun for wet inches, as practised by the Excise.

## DIMENSION BOOK.

<i>Round Guile Tun, No. 2, gauged Aug. 28, 1821.</i>					
Depths from the Bottom.	Mean Inches.	Areas in Gallons.	Contents in Gallons.	Areas. in B. F. G.	Contents in B. F. G.

	0 1 1.093		0 1 1.093		0 1 2.336

In the same manner the content may be obtained at every *wet* inch; and by way of practice, the Learner is required to continue the process, and form a Table Book.

*Note.* In the foregoing Example, the depth of the drip is *one* inch; consequently, the content of the drip added to the area of the first Section, gives the content of the tun at 2 inches, as shown in the above Table.

EXAM. 2.

Supposing the dimensions of the foregoing guile-tun to be taken from the top towards the bottom; it is required to tabulate the vessel for *dry* inches, as practised in the Excise.

DIMENSION BOOK.

<i>A. B.'s Round Guile Tun, No. 2, gauged Aug. 28, 1821.</i>

	0	13.954		0	13.954		0	14.453

By proceeding as above, the content at every *dry* inch may be obtained ; and the Learner is required to continue the process, and form a Table Book.

PROBLEM XI.

*To gauge and inch an elliptical guile-tun, and make an allowance for the drip or fall.*

*Directions for taking the dimensions, &c. &c.*

Pour in water to cover the bottom ; then quarter the tun ; and measure transverse and conjugate diameters in the middle of every 10 inches. Multiply the transverse diameter of each section, by the conjugate diameter ; divide the products by 359.05 ; and the quotients will be the areas of the respective sections. Multiply each area by its corresponding depth ; and you will obtain the content of the respective divisions. Then tabulate the tun, either for *wet* or *dry* inches, as directed in the foregoing Problems. (See Prob. VIII. of the first Section.)

EXAMPLES.

EXAM. 1.

The dimensions of an elliptical guile-tun, the areas of the several sections, and the contents of the different

1 i 3

divisions, are contained in the following Dimension Book ; it is required to tabulate the vessel for *dry inches*, as practised in the Excise.

### DIMENSION BOOK.

<i>A. B.'s Round Guile Tun, No. 3, gauged Sept. 5, 1821.</i>								
Divisions in Inches.	Depths from the Top.	Trans- verse Diameters	Conjugate Dis- meters.	Areas in Gal- lons.	Contents in Gal- lons.	Areas in B. F. G.	Contents in B. F. G.

### THE METHOD OF TABULATING THE FOREGOING GUILLE- TUN FOR DRY INCHES.

Dry In- ches.	Contents in B. F. G.	Dry In- ches.	Contents in B. F. G.	Dry In- ches.	Contents in B. F. G.
Full	16 2 2.602 0 1 0.782	4	15 1 8.474 0 1 0.782	8	14 1 5.346 0 1 0.782
1	16 1 1.820 0 1 0.782	5	15 0 7.692 0 1 0.782	9	14 0 4.564 0 1 0.782
2	16 0 1.038 0 1 0.782	6	14 3 6.910 0 1 0.782	10	13 8 3.782 0 1 1.710
3	15 3 0.256 0 1 0.782	7	14 2 6.128 0 1 0.782	11	13 2 2.072 0 1 1.710

In this manner may the content be obtained at every *dry inch* ; and the Learner is required to finish the process, and form a Table Book.

EXAM. 2.

Let the dimensions, areas, and contents remain the same as in the last example ; it is required to tabulate the guile-tun for *wet* inches.

THE METHOD OF TABULATING THE FOREGOING GUILLETUN FOR WET INCHES.

Wet Inches.	Contents in B.F. G.		Wet Inches.	Contents in B.F. G.		Wet Inches.	Contents in B.F. G.	
Drip	02	3.750	7	20	5.182	11	32	6.614
	01	4.858		01	4.858		01	4.858
4	03	8.608	8	22	1.040	12	40	2.472
	01	4.858		01	4.858		*	01 3.815
5	11	4.466	9	23	5.898	13	41	6.287
	01	4.858		01	4.858		01	3.815
6	13	0.324	10	31	1.756	14	43	1.102
	01	4.858		01	4.858		01	3.815

Thus may the content be obtained at every *wet* inch ; the Learner is required to continue the process, and enter in a Table Book.

Note 1. As the depth of the drip is 3 inches, it is evident that the content of the bottom Section added to the content of the drip, gives the content of the tun at 4 inches.

In consequence of the tun being tabulated for *wet* inches, from the same dimensions that were taken for *dry* inches, the nine-inch division falls at the bottom of the vessel, in both cases. This division would, however, have fallen at the top, if the dimensions had been taken with regard to *wet* inches only.

REMARKS.

When an oval guile-tun is not truly elliptical, it will be necessary, for the sake of accuracy, to find the areas of horizontal sections, by the method of equidistant ordinates, described in Problem XX. Part IV. This method will be well applied in Prob. III. of the fifth Section, in *gauging* and *inching* a Distiller's Wash Back.

2. Here it may not be improper to inform the young Learner, that mash-tuns are used for the purpose of mixing malt and hot water together in brewing, in order to extract the saccharine substance from the malt. From the mash-tun the liquor is received into the under-back ; from which it is conveyed into the copper, for the purpose of boiling it with hops. When the wort and hops have been boiled together a sufficient time, they are let out of the copper into the hop-back ; and thence the liquor is conveyed to the cooler, leaving the hops behind. When the liquor has remained in the cooler, until the heat has evaporated, it is then conveyed into the guile-tun, in order to be fermented with yeast or barm. After it has been in a state of fermentation a proper time, it is put into close casks, which operation is called "tunning" or "cleansing." Thus have we given a short account of the process of brewing, in order to show the purposes to which the vessels are applied, that are *gauged* and *fixed* in the foregoing Problems.

*Note.* In some brew-houses, no under-back is used ; the liquor being conveyed from the mash-tun into the copper. When this is the case, it is evident that one copper must be placed above the mash tun for boiling the water, and another below it, to receive and boil the wort ; and it may here be remarked, that much labour may be saved in pumping, when the vessels can be placed in such a manner, that the liquor can be conveyed from one to another by means of pipes. This may be most easily done, by building brew-houses upon inclined planes.

## PROBLEM XII.

*To deduct the heat from Common Brewers' warm wort.*

### RULE.

Divide the warm gauge by 10 ; and the quotient will be the deduction that must be made for the heat. Subtract this deduction from the warm gauge ; and the remainder will be the net gauge of the liquor, in barrels, firkins, and gallons.

*Note.* The method of deducting the heat from victuallers' warm wort, is given in Problem XIII. of the last Section.

## EXAMPLE.

. Suppose the content of a warm gauge to be 28 barrels, 3 firkins, and 6 gallons; what is the net gauge, after the heat has been deducted?

	B.	F.	G.	
10)	28	3	6	<i>warm gauge.</i>
	2	3	5	<i>deduction.</i>
	<hr/>			
	26	0	1	<i>net gauge.</i>
	<hr/>			

*Note 1.* In dividing the above warm gauge by 10, we obtain a quotient of 2 barrels, 3 firkins, and 8 over. Then,  $8 \times 4 + 3 = 32 + 3 = 35$  firkins; and this 35 divided by 10 also, gives a quotient of 3 firkins, and 5 over. Lastly,  $5 \times 4 + 6 = 20 + 6 = 26$  gallons; and by dividing 26 by 10, we obtain a quotient of 2 gallons; hence the whole quotient is 2 barrels, 3 firkins, and 2 gallons, the deduction required.

In deducting the heat from common Brewer's warm wort, it is customary to reject the decimal part of a gallon, when it is under .3; if it be .3 or upwards to .7, it is called half a gallon; and when it exceeds .7, it is called a whole gallon.

. The content of a warm gauge is 72 barrels, 1 firkin, and 2 gallons; what is the content when the heat is deducted. *Ans. 65 bar. 0 fir. 2.5 gal.*

. If the content of a warm gauge be 29 barrels, 3 firkins, and 8 gallons; upon how much liquor must the duty be charged? *Ans. 26 bar. 3 fir. 8 gal.*

## SECTION III.

THE METHOD OF GAUGING AND ULLAGING CASKS,  
AS PRACTISED IN THE EXCISE.

## CASK GAUGING.

*Preliminary Observations.*

CASK GAUGING is the most difficult that occurs in Practice. The true content of any *open* vessel may be easily determined ; but to ascertain the true content of a *close* cask, by mathematical rules, requires no ordinary share of experience, judgment, and skill. The difficulty arises from casks assuming such a variety of forms, with regard to the curvature of their staves ; and the impossibility of giving any *practical* rules, by which the true nature of these curves can be determined.

There are commonly reckoned four forms or *varieties* of casks, viz. ;

1. The middle frustum of a *spheroid*.
2. The middle frustum of a *parabolic spindle*.
3. The lower frustums of two equal *paraboloids*.
4. The lower frustums of two equal *cones*.

But as a spheroid is formed by the revolution of an ellipse ; a parabolic spindle by the revolution of the segment of a parabola ; a paraboloid by the revolution of a parabola ; and a cone by the revolution of a right-angled triangle ; it is more than probable that there never was a cask made, that *exactly* corresponded with any of these varieties ; for *experience* proves that few casks are to be met with, that will contain so much as the first form, or so little as the third or fourth ; hence it may be concluded that casks in general approach to the second variety ; or more probably to a variety between the second and third, which will be the middle frustum of a hyperbolic spindle.

Notwithstanding, Mathematicians affirm that it is almost impossible to make a cask to agree exactly with any of the four varieties before mentioned ; yet Excise Officers find it expedient, for the sake of order, accuracy, and expedition, to consider all casks as belonging to some of those varie-

ties. Hence it becomes of the utmost importance to be able to discover to which variety a cask makes the nearest approach, in order that we may apply proper rules in computing its content.

It will readily be perceived, by inspecting the following figure, that the head diameter, the bung diameter, and the length of one cask, may measure exactly the same as those of another; and yet the contents of those casks may differ from each other by several gallons.

For let A B C D E F represent all the four varieties of casks, each cask having the same head diameter A F or C D, the same bung diameter B E, and the same length G H; then it is manifest the cask whose curvature is represented by the external lines A B C, and D E F, will contain more than any of those casks, whose curvatures are denoted by the internal lines A B C, and D E F. It is also evident, that several varieties may be formed between the first and the fourth; hence the impossibility of giving any general rules, by which the *true* contents of all casks can be determined. However, to approach as near to the truth as the nature of the subject will admit; the general method adopted in the Excise, is to examine, very carefully, the casks that are about to be *gauged* and *fixed*; and compare one cask with another. Thus, when it is found that the staves of a cask are very much curved, it is supposed to belong to the *first variety*; when the staves

are not quite so much curved, the cask is considered as belonging to the *second variety*; when the curvature of the staves is very little, the cask is said to be of the *third variety*; and lastly, when the staves are straight from the bung to the head, the cask is denominated as being of the *fourth variety*.

After the variety of the cask has been determined, three dimensions are then measured, in inches and tenths, with the greatest accuracy; namely, the head diameter, the bung diameter, and the length. The cask is then reduced to a cylinder, by using proper multipliers; and hence its content is estimated with ease and expedition, as directed in Problem IV., Part V.

*Note.* Victuallers' casks are always gauged and fixed when they are empty; consequently, their dimensions may be easily obtained; but wine pipes, rum puncheons, &c. &c. are generally full of liquor, when they are gauged; and hence their dimensions cannot be ascertained with the same ease, accuracy, and expedition.

### PROBLEM I.

*To take the dimensions of a standing cask, when it is full of liquor.*

#### EXAMPLE.

Let the following figure represent a standing cask, full of liquor; it is required to determine the head diameter, the bung diameter, and the length.

*To find the head diameter.*

Measure the distance between the inside of the chimb, close to the head, and the outermost sloped edge of the opposite staff; and this will generally be the head diameter, within the cask, *very nearly*.

*Note.* When the staves are very thick, the distance from the inside of the chimb to the middle of the opposite staff will generally be equal to the internal head diameter; and sometimes the staves are so strong, that it is only necessary to include one-third of the thickness of the staff, in taking this dimension. In some cases, however, the staves are so slender, that it is necessary to measure from the inside of the chimb to the outside of the opposite staff, for the head diameter.

*To find the bung diameter.*

Lay a straight rod  $A B$ , across the centre of the head; and perpendicular to it, place another straight rod  $A D$ , so as to touch the bulge of the cask at  $E$ ; measure the distance between the outer edge of each chimb, at  $m$  and  $n$ ; also, measure  $A m$ , which should be equal to  $D r$ ; then twice  $A m$  added to  $m n$ , will give the bung diameter  $E F$ , including the thickness of the staff on each side of the cask. From this take twice the thickness of the staff at the bulge, as nearly as your judgment directs, having regard to the size of the cask; and you will obtain the internal bung diameter.

Or, from the rod  $A B$ , suspend a plumb-line  $B C$ , by a noose or loop at one end; and slide it backward and forward, on the rod, until the line just touches the bulge of the cask at  $F$ ; then twice  $B n$  added to  $m n$ , will be the external bung diameter  $E F$ , as before.

*Note 1.* The external bung diameter of a standing cask may also be found by dividing the circumference by 3.1416. (See Prob. XI., Part IV.; also Note 3, Prob. IX. of this Section.)

2. The staves of casks in general, are thicker at the bulge than at the head; London-made casks, however, have their staves commonly much thicker at the head than at the bulge. The best method of forming a correct judgment, is to examine empty casks of the same size and make, as those you are about to gauge. By this means, you will come to tolerably correct conclusions relating to the deductions necessary to be made for the thickness of the heads, staves, &c. (See the next Problem.)

*To find the length.*

If there be a hole in the upper head, introduce a rod, and take the external length, from which deduct the

K k

thickness of the upper head; and the remainder will be the internal length of the cask. If this cannot be done measure the external length  $A D$ , from which subtract twice the depth of the upper chime, together with the thickness of the two heads, as nearly as you can judge and the remainder will be the internal length of the cask.

### PROBLEM II.

*To take the dimensions of a lying cask, when it is full of liquor.*

#### EXAMPLE.

Let the following figure represent a lying cask full of liquor; it is required to determine the head diameter, the bung diameter, and the length.

*To find the head and bung diameters.*

Measure the head diameter in the same manner as directed for a standing cask; then introduce a rod into the cask at  $E$ , and measure the bung diameter  $E F$ , from which make a deduction for the thickness of the staff, at the bung-hole; and you will have the internal head and bung diameters of the cask.

*To find the length.*

The length may be most expeditiously found by a pair of long callipers, taking care to make proper allowance for the thickness of the heads; but as it cannot be expected that every person concerned in gauging, is in pos-

session of this instrument, the length of a cask may be obtained in the following manner: Apply a straight rod, *A B*, to the bulge of the cask; and at right angles to it, place two others, *A D* and *B C*, touching the chimbs at each end, and making *A m* equal to *B n*; then measure the distance from *A* to *B*, where the three rods intersect each other; from this subtract the depth of the chimbs, together with the thickness of both the heads, as nearly as you can judge; and the remainder will be the internal length of the cask.

*Note 1.* In taking the dimensions of a cask, the Gauger ought carefully to observe that the bung-hole be in the middle; that the bung-staff be regular and even within; and that the staff opposite the bung-hole be neither thicker nor thinner than the rest, which he may easily ascertain by the gauging rod; and if any impropriety be discovered, a proper allowance must be made for it in the dimensions.

2. It is also necessary to observe that the heads of the cask be equal, and truly circular; if not take cross diameters of each head, and divide their sum by their number for a mean diameter.

### PROBLEM III. . . .

*To gauge and fix a cask of the first variety, as practised in the Excise.*

#### RULE I.

Multiply the difference between the head and bung diameters, when it is 6 inches or less, by .68; but if the difference between these diameters exceed 6 inches, multiply it by .70; add the product to the head diameter; and the sum will be the mean diameter of the cask. Multiply the square of the mean diameter by the length; divide the product by 359.05, and 294.12; and the respective quotients will be the content in ale and wine gallons.

#### RULE II.

Find the mean diameter as directed in the last Rule; then enter the Tables of Ale and Wine areas, and take out the areas corresponding to the mean diameter. Multiply these areas by the length of the cask; and the respective products will be the content in ale and wine gallons. (See Prob. XIII., Part IV.; and also Prob. IV., Part V.)

## BY THE SLIDING RULE.

Find the difference between the bung and the head diameters, on the inside of the slide marked C; and opposite to it, on the line marked *spheroid*, is a number, which being added to the head, will give the mean diameter. Then, as the gauge-point on D, is to the length of the cask on C; so is the mean diameter on D, to the content on C.

*Note.* Neither of the foregoing methods of finding a mean diameter, is mathematically correct; but in consequence of their simplicity, they are generally adopted by Officers of the Excise.

## EXAMPLES.

1. The length of a cask is 45, the bung diameter 36, and the head diameter 27 inches; what is its content in ale and wine gallons?

## BY RULE I.

Bung Diameter.....	36 inches.
Head Diameter.....	27 inches.
Difference.....	9 inches.

Divisor 359.05)49900.05(138.977 ale gallons.

Also,  $49900.05 \div 294.12 = 169.658$ , the content in wine gallons.

## BY RULE II.

- Here the mean diameter is 33.3 inches; and having entered the Tables of ale and wine areas, in Part VII., we find the areas corresponding to 33.3 inches, are 3.0884 ale, and 3.7702 wine gallons; then,  $3.0884 \times 45 = 138.978$ , the content in ale gallons; and  $3.7702 \times 45 = 169.659$ , the content in wine gallons.

## BY THE SLIDING RULE.

The difference between the head and bung diameters is 6.33 inches; against this number, on the line of inches, we set 6.33 on the line marked *spheroid*, which being added to the head diameter, gives 33.33 inches, for the diameter. Then,

On D.	On C.	On D.	On C.
{ 18.95 }	: 45 ::	33.33 :	{ 139.0 ale gallons.
{ 17.15 }			{ 169.7 wine gallons.

The head diameter of a cask measures 24.6, the bung diameter 30.9, and the length 46.7 inches; what is the content in ale and wine gallons?

*s. The content is 109.460 ale, and 133.625 wine gallons.*

The length of a cask measures 32.5, the bung diameter 26.2, and the head diameter 21.4 inches; what is the content in ale and wine gallons?

*s. The content is 55.220 ale, and 67.414 wine gallons.*

The head diameter of a cask measures 19.6, the bung diameter 23.4, and the length 27.7 inches; required the content in ale and wine gallons?

*s. The content is 38.021 ale, and 46.416 wine gallons.*

## REMARK.

The casks given in the foregoing Examples, be considered as the middle frustums of spheroids, their contents be obtained by Prob. XIV., Part V. The content of the cask given in the first Example, is found to be 138.741 gallons, which differs only two-tenths of a gallon from the content found in this Problem.

## PROBLEM IV.

*Measure and fix a cask of the second variety, as practised in the Exercise.*

## RULE I.

Multiply the difference of the diameters, when it is 6 inches or less, by .62; but if it exceed 6 inches, by .64; the product to the head diameter; and the sum will be

the mean diameter of the cask. Proceed with this diameter, as directed in the last Problem; and you will obtain the content in ale and wine gallons.

### RULE II.

Find the areas in ale and wine gallons, which correspond to the mean diameter; then multiply these areas by the length of the cask, and the respective products will be the content in ale and wine gallons.

### BY THE SLIDING RULE.

Find the difference of the diameters, on the inside of the slide marked C; and opposite to it, on the line marked *2nd Variety*, is a number, which being added to the head, will give the mean diameter, with which proceed as directed in the last Problem.

### EXAMPLES.

1. The head diameter of a cask is 27, the bung diameter 36, and the length 45 inches; what is the content in ale and wine gallons?

### BY RULE I.

<i>Bung diameter...</i>	36 inches,
<i>Head diameter...</i>	27 inches.
<i>Difference .....</i>	9 inches,
<i>Multiplier .....</i>	.64

36

54

<i>Product:.....</i>	5.76

Divisor 359.05)48294.7920(134.507 ale gallons.

Also,  $48294.792 \div 294.12 = 164.200$ , the content in wine  
ons.

### BY RULE II.

Here the mean diameter 32.8 inches ; the areas answering  
this diameter, are 2.9968 ale, and 3.6579 wine gallons ;  
 $2.9968 \times 45 = 134.8335$ , the content in ale gallons ; and  
 $3.6579 \times 45 = 164.6055$ , the content in wine gallons.

### BY THE SLIDING RULE.

The difference between the head and bung diameters is  
inches ; against this number on the line of inches, we  
5.78, on the line marked 2nd variety, which being  
ed to 27, the head diameter, gives 32.78 inches, the  
n diameter. Then,

On D.    On C.    On D.    On C.

As  $\left\{ \begin{array}{l} 18.95 \\ 17.15 \end{array} \right\} : 45 :: 32.78 : \left\{ \begin{array}{l} 134.5 \text{ ale gallons.} \\ 164.2 \text{ wine gallons.} \end{array} \right.$

. The head diameter of a cask is 24.6, the bung dia-  
er 30.9, and the length 46.7 inches ; what is the con-  
t in ale and wine gallons ?

Ans. The content is 106.626 ale, and 130.165 wine gallons.

. The length of a cask is 32.5, the bung diameter 26.2,  
the head diameter 21.4 inches ; what is the content in  
and wine gallons ?

Ans. The content is 53.888 ale, and 65.786 wine gallons.

. The head diameter, bung diameter, and length of a  
c are 19.6, 23.4, and 27.7 inches ; required the content  
in ale and wine gallons ?

Ans. The content is 37.339 ale, and 45.583 wine gallons.

### REMARK.

If the foregoing casks be considered as the middle frus-  
is of parabolic spindles, their contents may be obtained by  
b. XVI., Part V. The content of the cask given in the  
Example, is found to be 137.887 ale gallons, which is  
3 gallons more than the content found by this Problem.  
The contents found by this Problem are, however, very  
nearly the same as the true contents found by Problem  
; hence we may conclude, that the method given in  
this Problem is well adapted for Practical Gauging. (See  
remarks at the end of Problem IX.)

## PROBLEM V.

*To gauge and fix a cask of the third variety, as practised in the Excise.*

## RULE.

When the difference of the diameters is 6 inches or under, multiply it by .55 ; but if it exceed 6 inches, by .57 ; add the product to the head, and the sum will be the mean diameter, with which proceed as before directed.

*Note.* The content by the Tables of ale and wine areas, and by the Sliding Rule, may be found as directed in the two last Problems ; and as the 3rd and 4th varieties of casks are not placed on any of the slides, the mean diameter found by the multiplier, must be used in casting the content by the Sliding Rule.

## EXAMPLES.

1. The length of a cask is 45, the bung diameter 36, and the head diameter 27 inches ; required the content in ale and wine gallons ?

## BY THE PEN.

Also,  $46455.1605 \div 294.12 = 157.946$ , the content in wine gallons.

BY THE TABLES OF ALE AND WINE AREAS.

The areas answering to the mean diameter 32.1 inches, are 2.8698 ale, and 3.5034 wine gallons; then  $2.8698 \times 45 = 129.141$ , the content in ale gallons; and  $3.5034 \times 45 = 157.653$ , the content in wine gallons.

BY THE SLIDING RULE.

On D.    On C.    On D.    On C.

As  $\left\{ \begin{array}{l} 18.95 \\ 17.15 \end{array} \right\} : 45 :: 32.13 : \left\{ \begin{array}{l} 129.4 \text{ ale gallons.} \\ 158.0 \text{ wine gallons.} \end{array} \right.$

2. The head diameter of a cask is 24.6, the bung diameter 30.9, and the length 46.7 inches; what is the content in ale and wine gallons?

Ans. The content is 103.367 ale, and 126.186 wine gallons.

3. The head diameter, bung diameter, and length of a cask, are 21.4, 26.2, and 32.5 inches; required the content in ale and wine gallons.

Ans. The content is 52.136 ale, and 63.648 wine gallons.

4. The length of a cask is 27.7, the bung diameter 23.4, and the head diameter 19.6 inches; what is the content in ale and wine gallons?

Ans. The content is 36.325 ale, and 44.347 wine gallons.

REMARK.

If the foregoing casks be supposed to be formed by the frustums of equal paraboloids joined together at their greater ends, their contents may be obtained by Prob. XVIII. Part V. The content of the cask in the first Example, is found to be 126.897 ale gallons, which is 2.486 gallons less than the content found in this Problem.

## PROBLEM VI.

*To gauge and fix a cask of the fourth variety, as practised in the Excise.*

## RULE.

If the difference of the diameters be 6 inches or less, multiply it by .50 ; but if greater than 6 inches, by .52 ; add the product to the head, and the sum will be the mean diameter, with which proceed as before directed.

*Note.* The content by the tables of ale and wine areas, and by the sliding rule, may be determined as in the last Problem.

## EXAMPLES.

1. What is the content of a cask, in ale and wine gallons, the head diameter of which measures 27, bung diameter 36, and length 45 inches ?

## BY THE PEN.

Also,  $45163.0080 \div 294.12 = 153.552$ , the content in wine gallons.

BY THE TABLES OF ALE AND WINE AREAS.

The areas answering to the mean diameter 31.7 inches, are 2.7987 ale, and 3.4166 wine gallons; then  $2.7987 \times 45 = 125.9415$ , the content in ale gallons; and  $3.4166 \times 45 = 153.747$ , the content in wine gallons.

BY THE SLIDING RULE.

On D.    On C.    On D.    On C.

As  $\left\{ \begin{array}{l} 18.95 \\ 17.15 \end{array} \right\} : 45 :: 31.68 : \left\{ \begin{array}{l} 125.9 \text{ ale gallons.} \\ 153.7 \text{ wine gallons.} \end{array} \right.$

2. The head diameter, bung diameter, and length of a cask are 24.6, 30.9, and 46.7 inches respectively; what is the content in ale and wine gallons?

Ans. The content is 107.070 ale, and 123.382 wine gallons.

3. The length of a cask is 32.5, the bung diameter 26.2, and the head diameter 21.4 inches; what is the content in ale and wine gallons?

Ans. The content is 51.268 ale, and 62.591 wine gallons.

4. What is the content of a cask, in ale and wine gallons, the head diameter of which measures 19.6, the bung diameter 23.4, and the length 27.7 inches?

Ans. The content is 35.661 ale, and 43.536 wine gallons.

REMARK.

If the casks in the foregoing Examples be considered as formed by the frustums of equal cones, joined together at their greater ends, their contents may be obtained by Prob. VIII., Part V. The content of the cask given in the first Example, is found to be 125.205 ale gallons, which differs only .579 of a gallon, from the content found by this Problem.

Combination of the Rules given in the four last Problems.

As it is more convenient, in Practice, to have all the Rules placed under the eye at once, than to consult different Problems for them, they are exhibited on the following page, in as concise a manner as possible.

The side which contains the line of inches and tenths, also contains a line of circular ale areas, which shews the area of the base of any cylindrical vessel, when the Rule is applied to its diameter ; hence, the content may be found by multiplying this area by the depth of the vessel.

The other two faces of the Rule contain the same lines that are on the Sliding Rule described in Part II. By unfolding Brannan's Rule to 24 inches in length, and placing the two parts back to back, it will perform the principal offices of the Sliding Rule ; namely, those of finding the areas and contents of vessels, in ale and wine gallons, and malt bushels ; the contents and ullages of casks, &c. This property of Brannan's Rule forms the chief difference between it and the Diagonal Rod before described.

This rule is also a branch of the dimension cane, noticed in Prob. I., Part VI.

*To find the content of a cask by the Diagonal Rod.*

#### RULE.

Put the Diagonal Rod into the bung-hole of the cask, in such a manner that the extremity of the rod may meet the head where it intersects the opposite side of the cask ; and the content will be exhibited in ale gallons on one diagonal line, and in wine gallons on the other ; reckoning from the end of the rod to the centre of the bung-hole.

*Note.* As the bung-holes of casks are not always in the middle, it is most correct to take both the diagonals in inches and tenths ; and the content corresponding to the mean diagonal, will be the true content of the cask, by the Diagonal Rod.

#### BY THE SLIDING RULE.

As 21.2 on D, is to the diagonal on C ; so is the diagonal on D, to the content in ale gallons on C. Or,

As 19.2 on D, is to the diagonal on C ; so is the diagonal on D, to the content in wine gallons on C.

*Note 1.* Those who have neither a Diagonal Rod nor a Sliding Rule, may nevertheless find the content of a cask in the following manner :— Measure the diagonal of the cask in inches and tenths ; then multiply the cube of this diagonal by .002228, and .00272 respectively ; and the products will be the content in ale and wine gallons.

2. When the diameters and length of a cask are given, its diagonal may be found by Prob. VI. ; and when the diagonal and diameters are given, its length may be determined by Prob. VII., Part I.

## EXAMPLES.

1. The diagonal of the cask given in the first Example in the foregoing Problems, is 38.7 inches; required the content of the cask in ale and wine gallons.

## BY THE DIAGONAL ROD.

*Opposite to 38.7 inches, the given diagonal, we find 129.8 ale gallons, and 158.3 wine gallons, the contents required.*

## BY THE SLIDING RULE.

On D.    On C.    On D.    On C.  
*As*  $\left\{ \begin{array}{l} 21.2 \\ 19.2 \end{array} \right\} : 38.7 :: 38.7 : \left\{ \begin{array}{l} 129.8 \text{ ale gallons.} \\ 158.2 \text{ wine gallons.} \end{array} \right.$

## BY NOTE I.

*Here  $38.7 \times 38.7 \times 38.7 = 1497.69 \times 38.7 = 57960.603$ , the cube of the diagonal; then  $57960.603 \times .002228 = 129.136223484$ , the content in ale gallons; and  $57960.603 \times .00272 = 157.65284016$ , the content in wine gallons.*

2. The diagonal of the cask given in the second Example, is 36.2 inches; what is the content in ale and wine gallons?

*Ans. The content is 106.0 ale, and 129.2 wine gallons.*

3. The diagonal of the cask given in the third Example, measures 28.6 inches; what is the content in ale and wine gallons?

*Ans. The content is 52.2 ale, and 63.8 wine gallons.*

4. The diagonal of the cask given in the fourth Example, measures 25.5 inches; required the content in ale and wine gallons?

*Ans. The content is 37.0 ale, and 45.1 wine gallons.*

## REMARK.

If the diagonal lines be applied to the head diameter of a regular made cask, they will generally express nearly half the content of the cask, in ale and wine gallons; but if the cask be remarkably long, and the head diameter small in proportion to the length, as in most wine casks, this method gives the content a great deal too little. For example, the diagonal of a wine cask is 37 inches, consequently, its content by the Diagonal Rod, is 189 wine gal-

lons. The head diameter of the same cask, is 24 inches; and twice the content answering to this, on the Diagonal Rod, is only 75 wine gallons; which is too little by 64 wine gallons.

### PROBLEM VIII.

*To find the contents of casks in general, from the head diameter, bung diameter, and length.*

#### RULE I.

Add into one sum, 89 times the square of the bung diameter, 25 times the square of the head diameter, and 26 times the product of these diameters; multiply this sum by the length of the cask, and the product by .00034; then divide the last product by 11 and 9 respectively; and the two quotients will be the content of the cask in ale and wine gallons.

*Note.* This rule is taken from Dr. Hutton's excellent Mathematical and Philosophical Dictionary, Vol. I., Page 578. It gives the contents of casks less than the Rule, for the second variety, and more than that for the third, being nearly in the middle between them; but the Dr. observes that, "it agrees well with the real contents of casks in general; as hath been proved by several casks which have actually been filled with a true gallon measure, after their contents had been computed by this method."

#### RULE II.

Divide the head diameter by the bung diameter, to two places of decimals, and find the quotient in the first column of the following Table, against which we have two multipliers, one for ale, and another for wine; these being respectively multiplied by the square of the bung diameter, and the product thence arising by the length of the cask will give the content in ale and wine gallons.

*Note 1.* If the quotient of the head by the bung diameter do not terminate in two places of figures, without a fractional remainder, find the multiplier answering to the first two decimals of the quotient, and subtract it from the next greater multiplier; then if the remainder be multiplied by the fractional part of the quotient, the product will be the corresponding proportional part to be added to the first multiplier.

*2.* This method ought always to be used when the fractional remainder is great, or when accuracy is required; but as it is sometimes

attended with considerable trouble, in multiplying the *tabular* remainder, by the numerator of the fraction, and then dividing the product by the denominator, the work may be much abridged in the following manner: When the numerator is *nearly* equal to one-fourth, one-half, or three-fourths of the denominator, take  $\frac{1}{4}$ ,  $\frac{1}{2}$ , or  $\frac{3}{4}$  of the tabular remainder, and add it to the multiplier corresponding to the first-two decimals of the quotient; and use the sum for the multiplier required.

3. This rule gives the content very nearly the same as Rule I.; and will be found much easier in Practice, as it generally requires fewer figures in the operation; particularly when the fractional remainder is rejected.

#### BY THE SLIDING RULE.

Divide the head by the bung diameter, as before directed, and find the gauge-points opposite to the quotient; then, as the gauge-point on D, is to the length of cask on C; so is the bung diameter on D, to the content of the cask on C.

*Note.* This method of finding the content of a cask by the Sliding Rule, is remarkably easy and expeditious.

### A TABLE OF MULTIPLIERS, &c.

## EXAMPLES.

1. The length of a cask is 45, the bung diameter 36, and the head diameter 27 inches; what is its content in ale and wine gallons?

## BY RULE I.

Here  $36 \times 36 \times 39 = 1296 \times 39 = 50544$ , thirty-nine times the square of the bung diameter;  $27 \times 27 \times 25 = 729 \times 25 = 18225$ , twenty-five times the square of the head diameter; and  $36 \times 27 \times 26 = 972 \times 26 = 25272$ , twenty-six times the product of the diameters; then  $(50544 + 18225 + 25272) \times 45 \times .00034 = 94041 \times 45 \times .00034 = 4231845 \times .00034 = 1438.8273$ ; hence  $\frac{1438.8273}{11} = 130.8024$ , the content in ale gallons; and  $\frac{1438.8273}{9} = 159.8697$ , the content in wine gallons.

## BY RULE II.

Here  $\frac{27}{36} = .75$ , the quotient of the head divided by the bung diameter. Opposite to this, in the Table of multipliers, we have .0022454 for ale, and .0027412 for wine gallons; then  $.0022454 \times 1296 \times 45 = 2.9100384 \times 45 = 130.951728$ , the content in ale gallons; and  $.0027412 \times 1296 \times 45 = 3.5525952 \times 45 = 159.866784$ , the content in wine gallons.

## BY THE SLIDING RULE.

The gauge-points opposite .75, in the Table, are 21.09 and 19.09, for ale and wine gallons; then,

On D. On C. On D. On C.

As  $\left\{ \begin{array}{l} 21.09 \\ 19.09 \end{array} \right\} : 45 :: 36 : \left\{ \begin{array}{l} 131.0 \text{ ale gallons.} \\ 159.9 \text{ wine gallons.} \end{array} \right.$

2. The head diameter, bung diameter, and length of a cask, are 24.6, 30.9, and 46.7 inches respectively; what is the content in ale and wine gallons?

Ans. The content is 104.1167 ale, and 127.2537 wine gallons.

3. The length of a cask is 32.5, the bung diameter 26.2, and the head diameter 21.4 inches; what is the content in ale and wine gallons?

*Ans.* The content is 53.0961 ale, and 64.8219 wine gallons.

4. What is the content of a cask, in ale and wine gallons, the head diameter of which measures 19.6, the bung diameter 23.4, and the length 27.7 inches?

*Ans.* The content is 36.7536 ale, and 44.8697 wine gallons.

### PROBLEM IX.

*To find the true content of any cask without paying regard to its variety, by means of four dimensions; namely, the length, the bung and head diameters, and the diameter in the middle, between the bung and head.*

*To find the middle diameter.*

Measure the head diameter, bung diameter, and length of the cask, as directed in the first and second Problems. Set off one-fourth of the internal length of the cask both ways, from the middle of the bulge at C, to  $m$  and  $r$ .

Lay a straight rod horizontally upon the cask, so as to touch the bulge at C, and in such a manner that the distance A  $x$ , of the rod from the chime, may be as nearly equal to the distance B  $x$  as possible. Measure the two distances  $m$   $n$  and  $m$   $r$ ; and subtract their sum from the

internal bung diameter; and the remainder will be the internal diameter required.

*Note 1.* When the rod A B, is not truly horizontal,  $m n$  will not be equal to  $m r$ ; the error however will be rectified by taking their sum from the internal bung diameter. When twice  $m n$  is taken from the bung diameter, instead of  $m n + m r$ , the error may be very considerable, if great care be not taken to have the rod A B parallel to the horizon, or more properly speaking, to the axis of the cask.

2. If the cask be standing on its head, as in the first Problem, set off one-fourth of the internal length, both ways from E towards the ends of the cask; and place the rod A D perpendicular, so that A  $m$  may be equal to D  $r$ ; then measure the distances between the rod A D and the two points made by setting off one-fourth of the cask's length; and subtract their sum from the internal bung diameter; and you will obtain the internal middle diameter of the cask.

3. The external bung, middle, or any other diameter of a cask, may be found to a considerable degree of accuracy, by dividing the circumference of the cask, by 3.1416. Then if twice the thickness of the staff be subtracted from the quotient, the remainder will be the internal diameter of the cask, at that place where the circumference is measured. Thus we have an easy, practical, and mathematical method of finding any diameter of a cask; care, however, must be taken to measure the circumference, and ascertain the thickness of the staves with the greatest accuracy. The latter may be performed by boring them through by an instrument adapted for that purpose, called a "Wood-Guage." (See Prob. XI., Part IV.)

#### REMARK.

Several writers on Gauging have committed most egregious blunders in directing their Readers to deduct twice  $m n$  plus twice the thickness of the staff, from the *internal* bung diameter, in order to obtain the *internal* middle diameter. If twice  $m n$  be taken from the external bung diameter, it is manifest that the remainder will be the external middle diameter; hence, it is evident that twice  $m n$  plus twice the thickness of the staff ought to be taken from the *external*, not the *internal* bung diameter, in order to obtain the *internal* middle diameter.

#### To find the content.

#### RULE I.

To four times the square of the middle diameter, add the sum of the squares of the bung and head diameters; multiply the sum thus obtained by the length; divide

the product by 2154.3, and 1764.72, and the respective quotients will be the content of the cask, in ale and wine gallons. (See Prob. XIX., Part V.)

## RULE II.

To four times the area corresponding to the middle diameter, add the areas corresponding to the bung and head diameters; multiply the sum by the length; and one-sixth of the product will be the content in ale or wine gallons, according to the denomination of the areas.

*Note 1.* The areas may be found either by Prob. XIII., Part IV.; or by the Tables of ale and wine areas, Part VII.

2. If the content of a cask, or any other vessel, in ale gallons, be multiplied by 11, and the product divided by 9, the quotient will be the content in wine gallons, nearly; and *vice versa*. (See the first Rule in the last Problem.)

3. The Rules given in this Problem are the same, in substance, as that given in Problem IX., Part V. (See the Scholium to that Problem.)

## BY THE SLIDING RULE.

Set the length on C, to 46.4 for ale, and 42.0 for wine, on D; and find the head, bung, and middle diameters on D, noting the three numbers opposite to them on C; then the sum of the first and second, added to 4 times the third, will give the content in ale or wine gallons.

## EXAMPLES.

1. The head diameter of a cask is 27, the middle diameter 33, the bung diameter 36, and the length 45 inches; what is the content in ale and wine gallons?

## BY RULE I.

Here  $33 \times 33 \times 4 = 1089 \times 4 = 4356$ , four times the square of the middle diameter; and  $36^2 + 27^2 = 1296 + 729 = 2025$ , the sum of the squares of the bung and head diameters; then  $(4356 + 2025) \times 45 = 6381 \times 45 = 287145$ ; and  $287145 \div 2154.3 = 133.289$ , the content in ale gallons; also,  $287145 \div 1764.72 = 162.714$ , the content in wine gallons.

 Content in wine gallons.....162.8 *sum.*

2. The length of a cask is 46.7, the bung diameter 30.9, the middle diameter 29.0, and the head diameter 24.6 inches; what is the content in ale and wine gallons?

*Ans.* The content is 106.739 ale gallons, and 130.303 wine gallons.

3. The head diameter of a cask is 21.4, the middle diameter 24.8, the bung diameter 26.2, and the length 32.5 inches; what is the content in ale and wine gallons?

*Ans.* The content is 54.378 ale, and 66.383 wine gallons.

4. The length of a cask is 27.7, the bung diameter 23.4, the middle diameter 22.1, and the head diameter 19.6 inches; what is the content in ale and wine gallons?

*Ans.* The content is 37.098 ale, and 45.290 wine gallons.

*A Table, shewing the Contents of Casks, in Ale Gallons, as found in the foregoing Problems.*

Example	Prob.III.	Prob.IV.	Prob. V.	Prob.VI.	Prob.VII	Prob.VIII	Prob. IX.
	1st Var.	2nd Var.	3rd Var.	4th Var.	Dia.Rod.	Gen. Rule.	True Rule
1	138.97	134.50	129.38	125.78	129.80	130.80	133.28
2	109.46	106.62	103.36	101.07	106.00	104.11	106.73
3	55.22	53.88	52.13	51.26	52.20	53.09	54.37
4	38.02	37.33	36.32	35.66	37.00	36.75	37.09

*Note.* If the casks given in the foregoing Examples be considered as the middle frustums of spheroids, the true content of the first, found by Problem XIV., Part V., is 138.741; of the second, 109.028; of the third, 55.240; and of the fourth, 38.041 ale gallons; which contents very nearly agree with those found by Problem III., of this Section. If the casks be considered as the middle frustums of parabolic spindles, the true content of the first, found by Problem XVI., Part V., is 137.387; of the second, 108.340; of the third, 54.962; and of the fourth, 37.892 ale gallons; which contents do not differ much from those found by Problem III., and considerably exceed those found by Problem IV., of this Section.

---

REMARKS,  
COMPARISONS, AND OBSERVATIONS  
ON  
CASK GAUGING.

---

By examining the foregoing Table, and comparing the contents in the different columns with each other, we readily perceive that the contents found by Problem III., exceed those found by any of the other Problems; that those obtained by Problems IV., and IX., are nearly equal to each other; that those given by Problems V., and VI., are less than those given by any of the other Problems; and that those found in Problems VII., and VIII., by the diagonal rod, and by Dr. Hutton's general rule, are nearly the same; but both less than those given by Problems IV., and IX.

Now, as the casks in the foregoing Problems, were gauged under very advantageous circumstances; each cask having one head out, which enabled us to take all the internal dimensions with the utmost accuracy; and as the method given in Problem IX., is *mathematically* correct, for all kinds of casks; we are inclined to conclude, from these and other premises obtained by experiment, observation, and comparison, that very few casks will contain so much as the *second variety*, considered as the middle frustum of a parabolic spindle.

We also coincide in opinion with Mr. Ward, Mr. Turner, Mr. Fletcher, Dr. Hutton, and many other eminent Gaugers and Mathematicians, that there is no such thing in existence as casks of the *first* and *fourth varieties*, considered as the middle frustums of spheroids, and the lower frustums of equal cones; and that the only true method of gauging casks, is by means of four dimensions, as directed in Problem IX.

We are of opinion that the apparent difficulty of obtaining the middle diameter, has prevented this method from being generally adopted; but this difficulty is only imaginary. The method we have given is extremely simple and easy; and if the operations be performed with care, will always give a true result. However, if a square be used in taking the middle diameter, instead of straight rods, every difficulty will vanish. This instrument may be made by any joiner or cabinet-maker. It consists of two pieces of mahogany, each about 38 or 40 inches in length,  $2\frac{1}{2}$  or 3 inches in breadth, and half an inch in thickness. The arms are laid one upon the other, and joined together near one end by means of a pin, which passes through them both; so that when the instrument is closed it is very portable, and when it is open it forms a square; the two arms being kept at right angles to each other by means of a pin or screw.

In using this instrument, one limb is laid diametrically across the end of the cask, in contact with the chimbs on each side; while the other is made to touch the bulge of the cask in the middle. In this position of the instrument, the middle diameter, or any other diameter between the head and bung may be easily obtained; marks having been previously made upon the sides of the cask, as directed in Problem IX. (See Note 3, of that Problem.)

*Note 1.* The only real difficulty which arises in taking external diameters, is from the wooden hoops with which some casks are bound. When a wooden hoop happens to be situated where the middle diameter falls, its thickness must be ascertained, and added to the distance  $w + r$ ; as in this case  $w$  and  $r$  will fall at the external part of the hoop; consequently, its thickness must be added in order to obtain the true distance between the horizontal rod, and the external part of the staff. (See the last Fig.) Or, to prevent further trouble, the hoop where the middle diameter falls, may be struck off the cask.

*2.* The deductions made by Port Gaugers, in order to reduce casks to the first variety, is another proof of the impropriety of the practice.

plied by some Officers of the Excise; namely, that of gauging all as belonging to the first variety. (See the method of gauging by Callipers.)

## Remarks, Comparisons, and Observations on CASK GAUGING,

BY DR. CHARLES HUTTON.

DR. HUTTON appears to have bestowed much pains on subject of Cask Gauging; and his remarks and experiments appear to be so judicious, that we think it our duty to lay them before the public, as given in his *Mensuration*, 8vo., price eighteen shillings in boards. After adding to the Rule given in Problem IX., he says, "The new Rule has been proved to be accurately true, not only for all the four different varieties of casks, but also all casks and solids generated from any conic section whatever; and although the cask be not precisely in the form of any such curve, the Rule will give the content very near the truth; so that whatever be the form of the cask, we may in all cases be pretty sure of the content to within  $\frac{1}{10}$  of a gallon, or perhaps less, supposing the dimensions to be truly taken. So that, more perfect than any other, both with respect to truth and expedition, nothing can be expected, or indeed wished for, in Gauging: which does me hope that one day this method will come into general use with the Practitioners in the Excise; and till then, I am fully persuaded that much of their Practice must be mere guess-work. The pretended difficulty of finding the middle diameter may perhaps deter some from using this method; but there cannot be any real difficulty in finding this diameter, except when a wooden hoop may happen to be at the part where the diameter ought to be taken; but that will very rarely happen."

The following collection of casks happened in real practice; and their dimensions were carefully taken; but their contents were computed by a Sliding Rule, and so cannot all be precisely true."

From hence it appears, that a *spheroidal* cask is a mere imaginary thing, the contents of real casks being less than is assigned to them by that form; as indeed they

ought, from the nature of the curves; for a spheroidal cask would be least curved in the middle, and the most at the ends: whereas a real cask is the least curved at the ends, if it be any thing curved there at all; and indeed there is reason to think it is not, as it appears from observation that all casks are in the form of the frustum of a cone near their ends; and that the middle part approaches nearer to the middle frustum of a parabolic spindle, than any other figure."

<i>Casks gauged by four Dimensions.</i>						
Num-ber.	Length.	Head diam.	Bung diam.	Middle diam.	Ale gallons.	Diff. less than sphr.
1	28.3	23.2	27.7	26.3	53.6	1.0
2	29.8	22.2	26.0	24.8	50.2	1.1
3	30.8	23.2	27.5	26.1	57.7	1.1

19	48.8	24.2	32.1	29.4	114.8	5.5
20	51.2	23.3	31.0	28.2	111.3	5.8
21	49.3	23.8	32.6	29.5	117.0	6.1
22	48.0	28.2	33.8	31.4	137.3	6.1
23	45.2	26.6	33.2	30.4	115.6	6.5
24	51.6	36.6	41.6	39.6	223.3	6.7

Casks gauged by four Dimensions.						
Num- ber.	Length.	Head diam.	Bung diam.	Mid. diam.	Als Gall.	Diff. less than spher
25	44.2	28.1	36.4	33.8	134.6	6.8
26	57.0	32.7	42.0	39.1	236.6	6.8
27	51.0	33.1	38.1	35.7	181.0	8.0
28	51.5	33.3	40.0	37.2	197.0	8.7
29	54.0	34.8	44.8	41.5	253.5	8.8
30	50.0	34.8	40.5	37.7	197.6	9.4
31	49.0	29.5	36.0	33.0	148.1	9.4
32	51.0	33.5	39.2	36.4	189.6	9.7
33	51.0	33.4	39.8	37.0	194.0	9.8
34	55.5	30.6	40.6	37.0	207.2	10.2
35	45.6	28.0	34.6	32.4	134.8	12.0
36	55.0	35.8	48.0	43.2	282.2	17.8

*Note.* If the figures opposite to each other, in the two last columns, be added together, their sum will be the contents of the casks, when gauged as spheroids; thus, 53.6 + 1.0 = 54.6 gallons, the content of No. 1, when gauged as a spheroid.

## ULLAGING CASKS.

THE liquor contained in a cask when it is not full, is called the **WET ULLAGE**; the vacuity or space not occupied by the liquor, is termed the **DRY ULLAGE**; and the method of finding the content of the liquor, is called *ullaging* a cask. Ullaging naturally divides itself into two cases; *first*, when the cask is in a horizontal position, or lying on its bulge; and *secondly*, when the cask is in a perpendicular position, or standing upon its head. Ullages are chiefly confined to the wine and spirit trades. They arise either from the leakage of casks, after they have been filled with liquor; or from its having been drawn off in sale.

The contents of ullages may be found either by the **Pen**, the **Sliding Rule**, or the **Ullage Rule**.

### DESCRIPTION OF THE ULLAGE RULE.

This is a flat Rule, either nine or twelve inches in length; and has all the lines upon it that are upon the **Sliding Rule**, described in Part II.; and consequently

M m 8

may be used in the same manner, in finding the areas and contents of vessels, casting malt-gauges, &c. &c.

The two slides marked B, work together ; and are used with the two lines of segments, in casting the ullages of casks.

This instrument has a considerable advantage over the common Sliding Rule, as by it we can find the ullages of both standing and lying casks, without changing the slides ; consequently it is very expeditious in casting the stocks of Wine Merchants, Spirit Merchants, &c. &c. where the standing and lying ullages are frequently numerous.

### PROBLEM X.

*To ullage a lying cask, having the bung diameter, wet inches, and content.*

#### RULE.

##### BY THE PEN.

Divide the wet inches by the bung diameter, to three places of decimals ; and if the quotient exceed .500, add to the said quotient one-fourth of the excess ; but if it be less than .500, subtract one-quarter of the deficiency ; then multiply the whole content of the cask by the sum in the first case ; or the remainder in the second, and the product will be the ullage required.

##### BY THE SLIDING RULE.

Set the bung diameter on C to 100 on the line marked *Seg. Ly.* or *S. L.* ; then against the wet inches on C, you will have a *segment* on the line *S. L.*, which call the fourth number.

Again, set the content of the cask on the line B, to 100 on the line A ; then against the fourth number on A, is the ullage of the cask on B.

Or, set the fourth number on B, to 100 on A ; then against the content of the cask on A, is the ullage on B.

*Note.* The latter method has a considerable advantage, in Practice, over the former ; as the fourth number may be so very easily transferred from the line of segments to the line B ; while, by the former method, there is some probability of the fourth number escaping the memory, before the content on the line B, can be placed to 100 on the line A.

## BY THE ULLAGE RULE.

Set the bung diameter on B, to 100 on the line marked *Seg. Lg.* or *S. L.*; then against the wet inches on B, you will have the fourth number on the line *S. L.*

Again, set the content of the cask on B, to 100 on A; then against the fourth number on A, is the ullage of the cask on B.

Or, set the fourth number on B, to 100 on A; then against the content of the cask on A, is the ullage on B.

*Note.* When the content of a cask is not known, it must be found from proper dimensions, before the above Rules can be applied.

## EXAMPLES.

1. Let A B C D represent a lying cask of the second variety, the head diameter of which measures 24, the bung diameter 32, and the length 40 inches; required the ullage of the cask in wine gallons; the wet inches E F being 21.6 inches.

*To find the content of the cask.*

## BY PROB. IV.

Here  $32 - 24 = 8$  inches, the difference of the diameters; and  $.64 \times 8 = 5.12$ ; then  $24 + 5.12 = 29.12$  inches, the mean diameter; hence we have  $29.12 \times 29.12 \times 40 = 847.9744 \times 40 = 33918.976$ ; and  $33918.976 \div 294.12 = 115.323$ , the content in wine gallons.

*To find the content of the ullage.*

## BY THE PEN.

Here  $21.6 \div 32 = .675$ , which exceeds .500 by .175, one-fourth part of which is  $= .04375$ ; then  $.675 + .04375 = .71875$ , the multiplier; hence  $115.323 \times .71875 = 82.88840625$  wine gallons, the ullage required.

## BY THE SLIDING RULE.

On C.    On S. L.    On C.    On S. L.  
As 32 : 100 :: 21.6 : 73.7 the fourth number.

And,

On A.    On B.    On A.    On B.  
As 100 : 115.3 :: 73.7 : 85.0 wine gallons.

Or,

As 100 : 73.7 :: 115.3 : 85.0 the ullage required,

## BY THE ULLAGE RULE.

On B.    On S. L.    On B.    On S. L.  
As 32 : 100 :: 21.6 : 73.7 the fourth number.

And,

On A.    On B.    On A.    On B.  
As 100 : 115.3 :: 73.7 : 85.0 wine gallons.

Or,

As 100 : 73.7 :: 115.3 : 85.0 the ullage required.

*Note.* If the whole content of the cask be multiplied by the fourth number, and two decimals more than those in the content and segment, be cut off; the result will be the content of the ullage, without using the lines A and B; thus  $115.3 \times 73.7 = 84.9761$  wine gallons, the content of the ullage, as before.

2. Required the ullage of the foregoing cask, when the wet inches are 10.4 inches.

*Ans.* 32.434 wine gallons, by the Pen; and 30.0 by the Sliding Rule.

## REMARK.

In the first Example the content by the Sliding Rule exceeds the content by the Pen; but the contrary is the case in the second Example; however, the sum of the two ullages either by the Pen or by the Rule, is equal to the whole content of the cask. The ullage found by the

Sliding Rule is undoubtedly more correct than that found by the Pen; and no other method is practised in the Excise; the Rule by the Pen is, however, very simple; and may be useful to those who are not in possession of a Sliding Rule.

### PROBLEM XI.

*To ullage a standing cask, having the length, the wet inches, and the content.*

#### RULE.

##### BY THE PEN.

Divide the wet inches by the length of the cask, to three places of decimals; and if the quotient exceed .500, add to the said quotient one-tenth of the excess; but if it be less than .500, subtract one-tenth of the deficiency; then the whole content of the cask being multiplied by the sum in the first case, or the remainder in the second, will give the ullage required.

##### BY THE SLIDING RULE.

Set the length of the cask on C, to 100 on the line marked *Seg. St.* or *S. S.*; then against the wet inches on C, you will have a segment on the line *S. S.*, which call a fourth number.

Again, set the content of the cask on B, to 100 on A; then against the fourth number on A, is the ullage of the cask on B.

Or, set the fourth number on B, to 100 on A; then against the content of the cask on A, is the ullage on B.

##### BY THE ULLAGE RULE.

Set the length of the cask on C, to 100 on the line marked *Seg. St. S. S.*; then against the wet inches on C, you will have the fourth number on *S. S.*

Again, set the content of the cask on C, to 100 on A; then against the fourth number on A, is the ullage on C.

Or, set the fourth number on C, to 100 on A; then against the content of the cask on A, is the ullage on C.

## EXAMPLES.

1. Let A B C D represent a standing cask of the second variety; required the ullage in wine gallons; the wet inches E F being 31.2 inches, the length 40 inches, and the content 115.323 wine gallons.

## BY THE PEN.

Here  $31.2 \div 40 = .780$ , which exceeds .500, by .280, one-tenth part of which is  $= .028$ ; then  $.780 + .028 = .808$ , the multiplier; hence  $115.323 \times .808 = 93.180984$  wine gallons, the ullage required.

## BY THE SLIDING RULE.

On C.    On S. S.    On C.    On S. S.  
As 40 : 100 :: 31.2 : 80.2 the fourth number.

And,

On A.    On B.    On A.    On B.  
As 100 : 115.3 :: 80.2 : 92.4 wine gallons.

Or,

As 100 : 80.2 :: 115.3 : 92.4 the ullage required.

## BY THE ULLAGE RULE.

On C.    On S. S.    On C.    On S. S.  
As 40 : 100 :: 31.2 : 80.2 the fourth number.

*And,*

On A.    On C.    On A.    On C.  
 As 100 : 115.8 :: 80.2 : 92.4 wine gallons.

*Or,*

As 100 : 80.2 :: 115.8 : 92.4 the ullage required.

2. What is the ullage of the foregoing cask, when the wet inches are 8.8 inches?

*Ans.* 22.142 wine gallons, by the *Pen*; and 23.0 by the *Sliding Rule*.

### PROBLEM XII.

To inch a standing cask of the second or third variety.

#### RULE.

*For the second Variety.*

1. From the area of the bung diameter, subtract the area of the head diameter; and multiply the remainder by 3.5. Divide the product thus obtained by 9 times the square of half the length of the cask; and the quotient will be a *common multiplier* for a cask of the second variety.

2. Multiply the square of the proposed distance from the bung, by the *common multiplier*; and subtract the product from the area of the bung diameter. Then multiply this remainder by the proposed distance from the bung; and the product will be the content of the cask from the bung to the extremity of the proposed distance.

3. Having thus found the content of the cask at 1, 2, 3, and 4 inches from the bung, the content at each of the remaining inches may easily be determined by the method of differences; for if we subtract each content from the following one, we shall obtain a set of *first differences*. Again, if these *differences* be subtracted from each other, we shall obtain a set of *second differences*; and lastly, by subtracting the second differences from each other, we shall obtain a set of *third differences*.

4. Now, as the third differences will be all equal to each other; it follows that by adding this common third difference to the first second difference, we shall obtain the

next second difference ; and if to this difference we again add the third difference, the sum will be the next second difference; &c. &c. until we have obtained all the *second differences*.

5. By subtracting any *second difference* from the corresponding *first difference*, we shall obtain the next first difference ; and by adding any first difference to the corresponding content, we may obtain the next content ; and thus we may determine the content at every inch from the bung to the head of the cask, either in ale or wine gallons.

6. Now, as the last of the first differences is considered to express the area, or *nearly* the area corresponding to the head diameter ; the next greater difference, the area corresponding to the diameter at the second inch from the head ; &c. &c., it follows that we may obtain the content at every inch from the head to the bung, by the successive addition of the first differences ; and then by adding the same differences, in a reversed order ; we may continue the tabulation from the bung to the upper head ; and thus obtain the content of the cask at every inch of its length ; as exhibited in the two following Tables.

## EXAMPLE.

The bung diameter of a cask of the second variety, is 26, the head diameter 22, and the length 30 inches ; it is required to find the content, in wine gallons, at every inch of its length, when it is standing upon its head.

## OPERATION.

	Inches.	Area.
Bung diameter	26 .....	2.2984 wine gallons.
Head diameter	22 .....	1.6456 wine gallons.
Difference	.....	.6528

14	29.1254	1.5989	.....	.....
15	30.7243	.....	.....	.....

## ELUCIDATION.

Having found the content of the cask, at 1, 2, 3, and 4 inches from the bung, as directed in Nos. 1 and 2 of the Rule; then by No. 3, we have  $4.5878 - 2.2973 = 2.2905$ ; also,  $6.8647 - 4.5878 = 2.2769$ ; and  $9.1214 - 6.8647 = 2.2567$ , the first three differences in the third column.

Again, we have  $2.2905 - 2.2769 = .0136$ ; also,  $2.2769 - 2.2567 = .0202$ , the first two differences in the fourth column.

And,  $.0202 - .0136 = .0066$ , the common difference in the fifth column; then by No. 4 of the Rule, we have  $.0136 + .0066 = .0202$ ; also  $.0202 + .0066 = .0268$ ; &c. &c. until we obtain all the differences in the fourth column.

By No. 5 of the Rule, we have  $2.2905 - .0136 = 2.2769$ ; also,  $2.2769 - .0202 = 2.2567$ ; &c. &c. until we obtain all the first differences in the third column. Also, by the same No. of the Rule, we have  $2.2973 + 2.2905 = 4.5878$ ; also,  $4.5878 + 2.2769 = 6.8647$ ; &c. &c. until we obtain all the contents in the second column. Thus having found the content at every inch from the bung to the head, we may then find the content at every inch from the head to the bung, by Subtraction, as follows:  $30.7243 - 29.1254 = 1.5989$ , the content at one inch from the head; also  $30.7243 - 27.4337 = 3.2906$ , the content at two inches from the head; &c. &c. until we have arrived at the bung, where the content is 30.7243; then by Addition, we have  $30.7243 + 2.2973 = 33.0216$ , the content at 16 inches from the head; also,  $30.7243 + 4.5878 = 35.3121$ , the content at 17 inches from the head, &c. &c. until we have obtained the content at every inch of the length. The cask may, however, be more easily tabled by Addition, as directed in No. 6 of the Rule; and exhibited in the following Table.

## A TABLE

*Shewing the Method of Inching the Cask given in the foregoing Example.*

Wet In- ches.	Con- tents.	Wet In- ches.	Con- tents.	Wet In- ches.	Con- tents.	Wet In- ches.	Con- tents.
1	1.5989 1.6917	8	15.0198 2.1565	15	30.7242 2.2974	22	46.4286 2.1099
2	3.2906 1.7779	9	17.1763 2.1965	16	33.0216 2.2905	23	48.5385 2.0567
3	5.0685 1.8575	10	19.3728 2.2299	17	35.3121 2.2769	24	50.5952 1.9967
4	6.9260 1.9305	11	21.6027 2.2567	18	37.5890 2.2567	25	52.5919 1.9305
5	8.8565 1.9967	12	23.8594 2.2769	19	39.8457 2.2299	26	54.5224 1.8575
6	10.8532 2.0567	13	26.1363 2.2905	20	42.0756 2.1965	27	56.3799 1.7779
7	12.9099 2.1099	14	28.4268 2.2974	21	44.2721 2.1565	28	58.1578 1.6917
8	15.0198	15	30.7242	22	46.4286	29	59.8495 1.5989
						30	61.4484

*Note 1.* The above Table is formed according to the directions given in No. 6 of the foregoing Rule; and the Table Book may be made as directed in Prob. I. of the last Section.

2. The content of the foregoing cask, found by Prob. IV., is 61.12 wine gallons.

3. We have not given the method of *inching* the first variety of casks, as we consider that this variety is never met with in practice.

## RULE.

*For the Third Variety.*

Divide  $\frac{1}{4}$  of the difference of the areas of the head and bung diameters, by the square of half the length of the cask; and the quotient will be a *common multiplier* for a cask of the third variety, with which proceed precisely as directed in the last Rule.

## EXAMPLE.

The head diameter of a cask of the third variety, is 24, the bung diameter 30, and the length 40 inches; it is required to find the content, in wine gallons, at every inch of the depth, when it is standing upon its head.

*Ans.* The content of one inch from the bung, is 3.0588; of two inches, 6.1102; of three inches, 9.1470; of four inches, 12.1617; and the whole content, found by inching the cask, is 102.5426 wine gallons. (See the Key to this Work.)

## REMARK.

The foregoing method of *inching* casks is attended with considerable labour; notwithstanding this, Officers had much better *inch* all Spirit Merchants' casks that are fixed for general use, even by this tedious method, than have several ullages to cast every time they survey such traders. If diameters could be taken in the middle of every 8 or 10 inches, from the head to the bung, any cask might then easily be inched in the same manner as a guile-tun; and we certainly conceive it possible to obtain these diameters to a considerable degree of accuracy, by some of the methods laid down in the *ninth* Problem of this Section, and the subjoined Remarks.

*Note.* Large casks used by Distillers and Rectifiers, as store-casks, have man-holes in their upper heads; consequently, the Gauger may descend into the casks, and take cross diameters in the middle of every 6, 8, or 10 inches; and hence the casks may be tabulated with as much ease and accuracy as circular guile-tuns.

## CASK GAUGING BY THE CALLIPERS.

*The Method of Gauging Casks by the Callipers, Bung Rod, and Head Rod, as practised in the Ports of Great Britain and Ireland, by the Port Gaugers of the Excise and Customs.*

## DESCRIPTION OF THE INSTRUMENTS.

The instruments used by the Port Gaugers of the Excise and Customs, are four in number; namely, the Long Callipers, the Cross Callipers, the Bung Rod, and the Head Rod.

*The Long and Cross Callipers.*

The Long Callipers are used in taking the length of a cask; and the Cross Callipers in taking the horizontal bung diameter. Each of these instruments consists of a stock, which is divided into inches and tenths; and two legs fixed at the ends of the stock, and forming with it two right angles.

The stock is divided into two parts which slide by each other; the legs are brought in contact with the heads, or with the bulge of the cask; and the length, or the horizontal bung diameter, is expressed by the inches and tenths upon the stock.

The Long Callipers are constructed in such a manner as to allow an inch for the thickness of each head; consequently, when the heads are exactly of that thickness, the Callipers will exhibit the internal length of the cask. If the heads exceed an inch in thickness, the excess must be deducted from the apparent length, as given by the Callipers; but if they be less than an inch in thickness, the deficiency must be added to the apparent length; and you will thus obtain the true internal length of the cask.

The Callipers are so simple, that further explanation is unnecessary. They may be completely understood by a few minutes inspection.

*Note.* The lower part of the legs of the Long Callipers are turned towards each other, in a direction parallel to the stock, in order that the chims may not prevent them from coming in contact with the heads of the cask. (See the next Fig.)

*The Bung Rod.*

This instrument is a slender, square rod, 48 inches in length; and divided into inches and tenths on two of its opposite sides. Another side contains the diagonal line for finding the contents of casks, in wine gallons, as directed in Problem VII.; and on the opposite side is a line of circular wine areas, for finding the contents of cylinders. This line exhibits the area of the base of any cylindrical vessel, in wine gallons, when the Rod is applied to the diameter; consequently, if this area be multiplied by the perpendicular depth, the product will be the content of the vessel, in wine gallons.

A brass sliding plate is fitted to the Bung Rod, large enough to cover the bung-hole of the cask ; and on the under side of this plate are two projecting slips of brass, each one inch in length ; and divided into four equal parts by notches, denoting  $\frac{1}{4}$ ,  $\frac{1}{2}$ , and  $\frac{3}{4}$  of an inch.

This instrument is chiefly used to take the perpendicular bung diameters of casks, and also the wet inches ; the horizontal bung diameter being taken by the Cross Callipers ; hence the mean bung diameter is obtained by taking half the sum of the perpendicular and horizontal diameters.

*Note 1.* The Brannan's Rule contains a line of circular ale areas, by which the contents of cylinders may be found in ale gallons, in the same manner as described above, for wine gallons. (See Problem VII., of this Section.)

2. These lines of areas are part of the Tables of ale and wine areas, in Part VII., transferred to the Diagonal Rod, Brannan's Rule, and Bung Rod.

### *The Head Rod.*

This instrument is a Sliding Rule, 45 inches in length ; having only one slide in the middle of the stock.

The lower part of the stock, on one side of the Rule, is divided from right to left, into inches and tenths, by which the head diameters of casks are taken. On the same side of the Rule, at the right end of the stock, is fixed a crooked piece of brass, which projects perpendicularly from the face of the Rule, about two inches ; and then turns to the right ; and upon the middle of the Slide is fixed another projecting piece of brass, that serves as an index to point out the head diameters of casks upon the lower part of the stock.

The upper parts of the stock and Slide, on the same side of the Rule, contain two lines marked C and D, which are used to find the contents of vessels, in the same manner as those on the common Sliding Rule, described in Part II. ; and the lower part of the Slide contains a line of inches and tenths ; adjoining those on the lower part of the stock. On the same side of the Slide, towards the left, is a line marked *spheroid*, which is used to find the mean diameters of casks, in order to reduce them to cylinders of equal contents.

The other side of the Rule contains three lines marked A, B, and N, which are all similar to each other ; and are used in the same manner as the lines A, B, and C, on the common Sliding Rule. The first of these lines is on the upper part of the stock ; the other two are on the Slide ; and below them, on the lower part of the stock, are the lines of *segments* for ullaging lying and standing casks, as directed in Problems X., and XI., of this Section.

(See the description of the Sliding Rule, Part II.)

*To take the Dimensions of Casks by the Bung Rod, Head Rod, and Callipers.*

#### PRELIMINARY OBSERVATIONS.

The Port Gaugers of the Excise and Customs do not finish the process of taking the dimensions of one cask, before they begin with those of another, as the Officers of the Excise do in gauging the casks of Victuallers. Wine and spirit casks are placed upon the Quays, in regular rows, with their bung-holes uppermost, as they are landed from the vessels ; and at such a distance from each other as to allow room for the play of the Cross Callipers, and to admit the Officers to pass freely between them. All the horizontal bung diameters of the first row, are then taken, by the Cross Callipers ; and put down upon the right bulges of the casks, with chalk. Cross diameters of the back heads are next taken, with the Head Rod ; and their means entered upon the left bulges of the casks.

The Bung Rod is next used to determine the perpendicular bung diameters and wet inches. From the cross bung diameters the mean bung diameters are determined ; and both them and the wet inches are put down upon the front heads of the respective casks ; the wet inches being generally placed undermost.

Three lengths of each cask are then taken with the Long Callipers ; namely, one over the bung-hole, and one on each side, at one-third of the circumference of the cask, from the top or middle of the bung-staff ; and from these three lengths the mean lengths are obtained, which are also entered upon the front heads ; leaving room for the mean head diameters to be placed below them.

Lastly, cross diameters of the front heads are taken; their means determined; and from the mean diameters of the two heads, the true mean head diameter of each cask is obtained. These mean diameters are put down immediately below the lengths; thus we have on each front head, the length, the head diameter, the bung diameter, and the wet inches of each cask.

The Officers then copy all the dimensions from the heads of the casks into their books; and to prevent mistakes, they compare the entries in their books with those upon the casks; and this completes the process of taking the dimensions.

*Note 1.* The greatest accuracy is observed in taking the dimensions of wine and spirit casks; and in order to prevent mistakes, and promote truth, the dimensions of the first Officer are *checked* by those of other Officers that follow him, and take the same dimensions, by similar instruments.

2. Sometimes the staff opposite the bung-hole is made much thicker than any of the other staves; at other times a piece of wood is *nicely* fixed upon it, in order to lessen the bung diameter; such frauds, however, may easily be discovered by drawing the Bung Rod two or three times over the bulge of the cask, in different directions; or by comparing the perpendicular with the horizontal bung diameter, after the thickness of the staves has been deducted. Or, if you bung the cask, and turn it one-fourth over, you may take the external bung diameter, by the Cross Callipers; and hence the internal bung diameter may be obtained by deducting twice the thickness of the staff at the bung-hole. (See the next article.)

3. The foregoing order of taking the dimensions of casks is not observed in all ports. Some Officers take the length first; then the head diameter; and lastly, the bung diameter and wet inches. (See the third Example.)

### *To take the Bung Diameter.*

Lay the Cross Callipers over the bung-hole of the cask with their legs downwards, and contract them until they touch the bulge of the cask on each side; and you will have the external horizontal bung diameter on the stock of the Callipers, from which deduct twice the thickness of the staff at the bung; and the remainder will be the internal bung diameter. Next take the perpendicular bung diameter, with the Bung Rod; and the mean between these two diameters, will be the true diameter of the cask. At the same time, by observing the upper ex-

tremity of the wet part of the Rod, you will obtain the *wet* inches, when the cask is not full, which is very often the case. The difference between the bung diameter and the wet inches will show the dry inches; hence either the *wet* or the *dry* ullage may be obtained. The dry ullage taken from the whole content of the cask, will leave the wet ullage.

*Note 1.* The thickness of the staves or heads of any cask may be accurately obtained by boring them through with an instrument adapted for that purpose, called a Wood-Gauge.

2. Suppose the horizontal bung diameter of a cask, as shown by the Callipers, to be 34.8 inches, and the thickness of both the staves 1.6 inches; then  $34.8 - 1.6 = 33.2$  inches, the internal bung diameter; and if the perpendicular diameter, by the Bung Rod, be 32.6 inches,

we have  $\frac{33.2 + 32.6}{2} = \frac{65.8}{2} = 32.9$  inches, the true bung diameter of the cask.

3. Here it must be observed, that when a cask is nearly full, and the perpendicular bung diameter is less than the true diameter, the difference must be added to the wet inches. Let the wet inches be 30.7; then as the perpendicular bung diameter, in the above Example is .3 less than the true diameter; we have  $30.7 + .3 = 31.0$  for the true wet inches. If the perpendicular bung diameter had exceeded the true diameter by .3; then  $30.7 - .3 = 30.4$ , would have been the true wet inches; for, according to general custom, the wet inches should always be increased or decreased in the same proportion as the perpendicular bung diameter is increased or decreased in finding the true diameter. However, in Practice, the same number is generally used for both purposes.

4. When casks are regularly made, and want several inches of being full; the foregoing additions and deductions are not always attended to in taking the wet inches.

### *To take the Head Diameter.*

Place the lower edge of the crooked brass that is on the end of the Head Rod, within the chimb of the cask, close to the head; then move the slide until the brass index intersects the middle of the opposite chimb; and you will have the internal head diameter of the cask, on the lower line of the stock, directly opposite to the index on the slide.

*Note.* The distance between the inside of the chimb and the middle of the opposite staff or chimb, will generally be equal to the internal head diameter. However, when the staves are remarkably strong, it will only be necessary to include one-third of the thickness of the chimb in taking the head diameter. (See a Note in Problem I., of this Section.)

*To take the Length.*

Lay the Long Callipers over the bung-hole, with their legs downwards, and contract them until their ends come in contact with the heads of the cask ; and you will have the length of the cask, on the stock, which allows an inch for the thickness of each head.

Again, measure other two lengths, one on each side of the bung, so that three lengths thus taken may be at equal distances from each other ; divide the sum of these lengths by their number ; and the quotient will be the mean length of the cask.

If the two heads exceed two inches in thickness, a deduction must be made ; but if they be less than two inches, an addition must be made for the difference, in taking the length by the Callipers ; and thus you will obtain the true internal length of the cask.

*Note 1.* Suppose the length of a cask, as taken by the Callipers, to be 48.6 inches ; and let the thickness of the two heads be 2.4 inches ; then  $48.6 - .4 = 48.2$  inches, the true internal length of the cask ; but if the thickness of the heads be only 1.8 inches ; then we have  $48.6 + .2 = 48.8$  inches, for the true internal length,

2. Before the length of a cask is put down upon the front head, as directed in the preliminary observations, a proper deduction should be made to reduce the cask to the first variety. Suppose the deduction to be six-tenths of an inch ; then in the first part of the above Example, instead of four-tenths we must deduct one inch ; hence the true length will be 47.6 inches. In the latter part of the Example, instead of adding two-tenths we must deduct the difference between two-tenths and six-tenths, which is four-tenths ; hence the true length will be 48.2 inches. (See the next article for deductions.)

*Allowances to be made in the lengths of casks, in order to reduce them to the first variety.*

It has already been observed that very few, if any casks will contain so much as the middle frustum of a spheroid ; and as the lines on the Head Rod, for casting the contents of casks, are calculated for that variety only, it becomes necessary to make such deductions in the lengths of casks as will, in the judgment of the Officers, reduce them to the first variety, before their contents are found. Now, as casks imported from different countries vary very much in their form and make, it is necessary that those deductions should vary accordingly ; hence such Tables of allowances

have been made by experienced Officers, and sanctioned by the Commissioners of the Customs, as will, in their opinion, effect the purpose for which they are intended. The following are the allowances mostly in use, in the different Ports of the United Kingdom; these however, are sometimes varied at the discretion of the Port Gaugers, on whose skill and experience, much of the accuracy of such Gauging will always depend.

TABLE OF DEDUCTIONS.

<i>Names of Casks.</i>	<i>Inches.</i>
Port pipes, about 6, 7, or .....	0.8
Lisbon pipes .....	1.3
Madeira pipes .....	1.3
Vidonia pipes .....	0.8
Mountain butts .....	0.4
Nice butts .....	2.3
Sherry butts .....	0.7
Rhenish half vats, or four aulms .....	0.7
Brandy puncheons about 4, 5, or .....	0.6
Rum puncheons 3, 4, or .....	0.5
Geneva puncheons, 5, 6, or .....	0.7
Salipoli or Olive oil casks from 0 to .....	1.0

1. In several Tables of allowances, 1.5 inches are put down for pipes; but experience proves this to be too much.

Deductions are seldom made for Port, Lisbon, Madeira, Vidonia, Sherry, and other hogsheds; as their heads are not often more than eight or nine-tenths of an inch in thickness; consequently no deductions are necessary, because the Callipers allow an inch for each

When casks are regularly formed, there are seldom any deductions made from the true wet inches of wine and oil casks. Three or four inches are generally deducted from the true wet inches of spirit casks; these deductions are entirely at the discretion of the Gauger. (See Instructions and Notes for taking the Bung Diameter.)

#### OF THE CONTENTS AND ULLAGES OF CASKS BY THE HEAD ROD.

*Reduce a cask to a cylinder, by finding a mean diameter.*

#### RULE.

Set the left end of the brass index which is on the middle of the head rod, to the head diameter on the lower line of the

stock; and opposite the bung diameter on the same line, note the number on the line marked *spheroid*. Then this number being added to the head, will give the mean diameter; or, opposite to this number on the lower line of the slide, we have the mean diameter on the lower line of the stock; and thus the cask is reduced to a cylinder.

*To find the content from the length and mean diameter.*

### RULE.

Set the brass mounting, or gauge-point that is at the left end of the slide D, to the length of the cask on the upper line of the stock C; then against the mean diameter on the line D, is the content of the cask, in wine gallons, on the line C.

*Note.* The contents of all casks that hold less than 60 gallons, are taken by the Diagonal Rod; and such deductions are made as the forms of the casks appear to warrant. The mean contents must always be found as directed in Problem VII.; and at the same time the bung diameters and wet inches must be taken, in order to cast the ullages.

*To find the ullage, from the content, bung diameter, and wet inches.*

### RULE.

Set the bung diameter on N, to 100 on the line of segments S. L.; then against the wet inches on N, you will have the fourth number on S. L.

Again, set the fourth number on B, to 100 on A; then against the content of the cask on A, is the content of the ullage on B. (See the Rules in Prob. X.)

### REMARK.

The Head Rod being 45 inches in length, is generally thought inconvenient for casting the contents and ullages of casks. To remedy this inconvenience, a similar Rod or Sliding Rule, 24 inches in length, is generally used for these purposes. This Rule contains all the lines that are on the Head Rod; but in an abridged form. The line of

inches on the lower part of the stock commences at 20, and proceeds to 44; that on the slide, adjoining the line *spheroid*, is only 12 inches in length; the line C, on the upper part of the stock, commences at 25; and the first number on the adjoining line D, on the upper part of the slide, is 18. The lines on the other side of the Rule are all perfect. This instrument is generally called a Jerkin.

#### EXAMPLES.

##### EXAM. I.

Let A B C D represent a Port pipe, on the Quay, with the Long Callipers, in the act of taking the length of the cask, over the bung-hole; and admit the dimensions to be taken in the order laid down in the Preliminary Observations, and to be as follow; namely, the horizontal bung diameter, including the thickness of the staves at the bulge, 34.0 inches; the back head diameters 23.2 and 23.4; the perpendicular bung diameter 32.6; the wet inches 28.6; three lengths 49.2, 48.8, and 48.7; the front head diameters 23.6 and 23.4; the thickness of each head 0.8; the thickness of the staff at the bung hole 0.9; and the deduction to be made in the length, in order to reduce the cask to the first variety, 0.6 inches; required the true dimensions of the cask, and also its content and ullage, in wine gallons.

O o

To find the true dimensions.

	<i>Inches.</i>
<i>External horizontal bung diameter ...</i>	<i>34.0</i>
<i>Twice the thickness of the staff ..... 1:8</i>	<i>1.8</i>
<i>Internal horizontal bung diameter ..... 32.2</i>	<i>32.2</i>
<i>Internal perpendicular bung ditto ..... 32.6</i>	<i>32.6</i>
<i>Divide by ..... 2)64.8</i>	<i>2)64.8</i>
<i>True bung diameter ..... 32.4</i>	<i>32.4</i>
<i>Wet inches ..... 28.6</i>	<i>28.6</i>

<i>Sum ..... 49.3</i>	<i>49.3</i>
<i>Deduction for the variety ..... 0.6</i>	<i>0.6</i>
<i>True length ..... 48.7</i>	<i>48.7</i>

*Note.* In Practice, the true dimensions are found mentally, which considerably shortens the operation. (See the Method of taking the Dimensions.)

**True Dimensions.**

	<i>Inches.</i>
Length.....	48.7
Head diameter ...	23.4
Bung diameter ...	32.4
Wet inches .....	28.4

**To find the Mean Diameter.**

*Set the brass index on the slide, to the head diameter 23.4 on the lower line of the stock; then against the bung diameter 32.4 on the same line of the stock, we have 6.3 nearly, on the line marked spheroid; and opposite this number on the lower line of the slide, we have 29.7, the mean diameter, on the lower line of the stock.*

**To find the content.**

*Set the gauge-point on D, to the length 48.7 on C; then against the mean diameter 29.7 on D, is 146 very nearly, on C, the content in wine gallons.*

**To find the ullage.**

*Set the bung diameter 32.4 on N, to 100 on S. L.; then against the wet inches 28.4 on N, we have 94, the fourth number, on S. L.*

*Again, set 94 on B, to 100 on A; then against 146, the content of the cask on A, is 137, the content of the ullage on B. (See Prob. X.)*

*Note.* Here it may not be improper to observe that the Head Rod will only cast the content and ullages of casks in wine gallons; ale gallons being seldom or never wanted in Port Gauging.

**EXAM. 2.**

The following are the dimensions of a Jamaica rum butt, as taken by the Callipers, Bung Rod, and Head Rod; namely, the external horizontal bung diameter 36.8 inches; the back head diameters 28.5 and 28.1; the perpendicular bung diameter 34.2; the wet inches 30.5; three lengths 36.4, 36.3, and 36.5; the front head diameters

28.6 and 28.4 ; the thickness of each head 1.2 ; the thickness of the staff at the bung-hole 1.0 ; and the deduction in the length, to reduce the cask to the first variety, 0.8 inches ; required the true dimensions of the cask, and also its content and ullage, in wine gallons.

*Ans. The true length is 35.2, the head diameter 28.4, the bung diameter 34.5, the wet inches 30.8, the content 127, and the ullage 121 wine gallons.*

### EXAM. 3.

The following Table contains the true dimensions of six wine pipes, from Madeira ; being part of the cargo of the *Mary Ann Jones*, of Newcastle-upon-Tyne. The dimensions, contents, and ullages, are given as found by the Port Gaugers of the Excise and Customs ; and, by way of Practice, the Learner is required to cast the content and ullage of each cask by the Head Rod.

TABLE OF DIMENSIONS, CONTENTS, AND ULLAGES.

No.	Length.	Head Dia.	Bung Dia.	Wet Inches.	Content.	Ullage.
1	47.5	22.4	27.3	24.7	107	103
2	46.8	21.3	27.9	25.9	106	103
3	48.4	21.7	27.8	26.0	110	108
4	47.2	22.3	27.8	25.7	109	106
5	47.1	22.3	27.5	25.9	107	105
6	48.3	22.3	27.5	25.7	110	108

*Note.* The mean diameter of No. one, is found to be 25.8 ; of No. two, 25.9 ; of No. three, 25.9 ; of No. four, 26.1 ; of No. five, 25.9 ; and of No. six, 25.9 inches ; hence the Contents and Ullages are found as in the two last columns of the above Table. (See the Key to this Work.)

*The Method of finding the Wet Ullages of Casks by subtracting the Dry Ullages from the whole Content.*

It has already been observed that the wet ullages of casks may be obtained by subtracting the dry ullages from the whole content. Now, it may be seen, by inspecting the preceding Table, that the dimensions and contents of the same species of casks seldom differ much from each other. Consequently, if we fix upon a regular made cask, suppose a Port pipe; and find the contents of a number of dry ullages, beginning at 1 dry inch, and proceeding to 3 or 4 inches; we may form such a Table from the results, as will express the contents of the dry ullages of Port pipes in general. The process of ullaging may then be performed with ease and expedition, by subtracting the ullages corresponding to the dry inches, from the whole contents of the casks.

**EXAMPLE.**

Let the length of a regular made Port pipe be 50, the bung diameter 32, and the head diameter 23 inches; it is required to find the content of all ullages from 1 to 4 dry inches.

*By the Head Rod, the mean diameter of the cask is found to be 29.3 inches, and its content 146 gallons; then by continually varying the dry inches, we find the fourth number corresponding to each segment; and hence the content of the ullages, as in the following*

**TABLE.**

Dry Inches.	Ullages.	Dry Inches.	Ullages.	Dry Inches.	Ullages.
1.0	0.7	2.1	2.8	3.1	5.8
1.1	0.8	2.2	3.1	3.2	6.1
1.2	0.9	2.3	3.4	3.3	6.4
1.3	1.0	2.4	3.7	3.4	6.7
1.4	1.2	2.5	4.0	3.5	7.0
1.5	1.4	2.6	4.3	3.6	7.3
1.6	1.6	2.7	4.6	3.7	7.6
1.7	1.8	2.8	4.9	3.8	7.9
1.8	2.0	2.9	5.2	3.9	8.3
1.9	2.2	3.0	5.5	4.0	8.7
2.0	2.5	....	....	....	....

In Port Gauging the contents of casks are always found in whole numbers ; therefore, from the preceding Table we form the following one, which is more convenient for Practical purposes.

A TABLE OF DRY ULLAGES FOR PORT PIPES.

Dry Inches.	Ullages.	Dry Inches.	Ullages.
From 1.0 to 1.4	1	From 3.0 to 3.3	6
From 1.5 to 1.9	2	From 3.4 to 3.6	7
From 2.0 to 2.3	3	From 3.7 to 3.9	8
From 2.4 to 2.6	4	From 4.0 to 4.2	9
From 2.7 to 2.9	5	.....	... ..

EXAMPLE.

The bung diameter of a Port pipe is 32.4, the wet inches 28.4, and the content 146 gallons ; required the content of the ullage by the preceding Table.

*Here  $32.4 - 28.4 = 4.0$ , the dry inches ; opposite to this number in the last Table, we find 9 gallons ; then,  $146 - 9 = 137$  gallons, the content of the ullage, the same as found by the Head Rod. (See the first Example.)*

*Note 1.* The last Table will answer very well for Brandy and Gin puncheons, and Madeira pipes. It gives the true ullages of all the casks contained in the third Example.

2. Similar Tables may be easily calculated for all other kinds of casks ; taking care to make choice of regular made casks from which to make the estimations.

3. If the Tables be committed to memory, the process of ullaging may be performed mentally ; and thus the business of Gauging will be greatly facilitated.

DIRECTIONS

*For Gauging Casks of an irregular Form.*

Irregularities in the forms of casks, should be particularly attended to, in taking the dimensions ; and such additions or deductions must be made, as will, in the opinion of the Gauger, reduce such casks to regular shapes, in order that their contents may be obtained with as much

accuracy as possible. If the middle diameter between the bung and head, be nearly equal to the bung diameter, the cask is said to be *high-quartered*. When this is the case, two or three tenths, &c. must be added to the true length, in order to increase the content. On the contrary, if a cask appears to be not sufficiently curved in the quarters; then two or three tenths, &c. at the discretion of the Officer, must be deducted from the true length, in order to decrease the content; as it is evident, in the first case, the cask will contain more, and in the second less, than if it were regularly formed.

If a cask be full-quartered, and flattened at the bung, so that the perpendicular is considerably less than the horizontal bung diameter; add a few tenths to the perpendicular bung diameter, in order to reduce the cask to a regular form. The general method is to add *two-thirds* of the difference; thus, if the horizontal diameter exceeds the perpendicular diameter, suppose .9; then .6 must be added to the perpendicular diameter; and also to the *wet* inches; and the sums thus obtained must be considered as the true bung diameter and *wet* inches of the cask.

If the perpendicular exceed the horizontal bung diameter; then a few tenths must be deducted from the perpendicular bung diameter. The general custom is to deduct *one-half* of the difference; thus, if the perpendicular diameter exceeds the horizontal diameter, suppose .8; then .4 must be deducted from the perpendicular diameter and *wet* inches, in order to obtain the true bung diameter and *wet* inches of the cask.

Every other irregularity that may be met with in casks, must be taken into consideration; and a proper allowance made in some of the dimensions. No general Rules can, however, be given that will apply in every case; consequently, much will always depend upon the skill and experience of the Officers.

*Note.* Every *unfairly made* cask should be rolled over, before it is gauged, in order that the Officer may obtain a proper idea of its shape and curvature.

## SECTION IV.

THE METHOD OF GAUGING AND FIXING MALTSTERS' UTENSILS, AS PRACTISED IN THE EXCISE.

---

*MALT GAUGING.*

---

## PRELIMINARY OBSERVATIONS.

NOTWITHSTANDING the methods of finding the areas and contents of all kinds of figures, in malt bushels, have already been given in Parts IV. and V. of this Work ; yet it is deemed necessary to shew the methods of gauging and fixing the Utensils of Maltsters, as practised in the Excise.

By Act of Parliament, Officers are to take account of all grain making into malt, by gauge only ; and estimate the quantity by the Winchester bushel of 2150.42 cubic inches.

It is also enacted that barley must be under water, in the cistern, 40 hours. In this time it is found by experiment to swell or increase to about *one-fourth* more than its original bulk ; consequently, *four* bushels in *twenty* are allowed for this increase.

From the cistern the barley is removed to the couch ; and after having lain there 26 hours, it is deemed a floor. The same allowance is made in the gauge of the couch as in that of the cistern ; but when the corn has been thrown out of the couch into the floor, and permitted to grow according to the regular custom, in making malt, it is supposed to increase about *one-half* ; hence an allowance is made of *ten* bushels in *twenty*.

It may also be observed that barley is first gauged in the cistern, then in the couch, next on the floor, and lastly on the kiln.

## PROBLEM I.

*To gauge and fix a Maltster's cistern, in the form of a parallelopipedon.*

*To take the dimensions.*

Measure three lengths near the top, and three near the bottom, at equal horizontal distances from each other; and divide their sum by their number, for the mean length. Find the mean breadth in the same manner; also, measure the perpendicular depth; and you will have all the necessary dimensions.

*Note.* In the real Practice of Gauging, the mean depth of the grain in a cistern is obtained by taking several depths, and dividing their sum by their number for a mean depth. The most convenient number of depths is ten; as the mean depth is then obtained by removing the decimal dot one place towards the left. Five depths, however, are generally thought sufficient.

*To find the area and content.*

BY THE PEN.

## RULE.

Multiply the mean length by the mean breadth; divide the product by 2150.42, and the quotient will be the area in malt bushels. Multiply this area by the depth of the cistern, and the product will be the content. (See Tables IX. and X. of Dry Measure, and the following Remarks, Part IV.)

*Note.* It is scarcely necessary to observe that the content of any quantity of grain in a cistern or couch, may be obtained by multiplying the area by the mean depth.

BY THE SLIDING RULE.

*To find the area.*

Set 2150.42 on A, to the length on B; then against the breadth on A, is the area on B.

*To find the content.*

Set unity on A, to the area on B; then against the depth on A, is the content on B.

*Or,*

The content may be found by means of the line M. D. on the Sliding Rule, without knowing the area, thus; set the length on B, to the depth on the line M. D.; then against the breadth on A, is the content on B.

#### EXAMPLES.

1. The length A B, of a cistern in the form of a parallelopipedon, is 96.8, the breadth A E 63.6, and the depth B C 45.3 inches; what is the area and content in malt bushels?

*Note.* Here A B and A E are considered to be the mean length and breadth of the cistern, found as before directed.

BY THE PEN.

*To find the area.*

*Inches.*

96.8 length.

63.6 breadth.

---

5808

2904

---

5808

Divisor 2150.42)6156.48(2.862 bushels, the area.

## BY THE SLIDING RULE.

*M. B.                  Length.                  Breadth.                  Area.*  
*As 2150.42 on A : 96.8 on B :: 63.6 on A : 2.86 on B.*

## BY THE PEN.

*To find the content.*

*Bushels.*  
 2.86 *area.*  
 45.3 *depth.*  

---

 858  
 1480  
 1144  

---

 129.558 *content.*  

---

## BY THE SLIDING RULE.

*Unity.                  Area.                  Depth.                  Content.*  
*As 1 on A : 2.86 on B :: 45.3 on A : 129.6 on B.*

*Or,*

*Length.                  Depth.                  Breadth.                  Content.*  
*As 96.8 on B : 45.3 on M.D. :: 63.6 on A : 129.6 on B.*

*To inch or tenth the foregoing cistern.*

Having found the area of the cistern, in malt bushels, we may hence easily form a Table by continual addition, which will exhibit the content at every inch of the depth ; thus  $2.86 + 2.86 = 5.72$ , the content at 2 inches ;  $5.72 + 2.86 = 8.58$ , the content at 3 inches, &c. &c.

A Table, however, still more useful in the Practice of Gauging, may be formed by *tenthing* the cistern ; and as cisterns are generally more than half full of grain, when gauges are taken, it will only be necessary to commence the *tenthing* at half the perpendicular depth, and continue it *nearly* to the top. Thus  $2.86 \times 20 = 57.2$ , the content at 20 inches of the depth ; and  $2.86 \div 10 = .286$ , the content at one-tenth of an inch ; hence,  $57.2 + .286 = 57.486$ , the content at 20.1 inches of the depth ;  $57.486 + .286 = 57.772$ , the content at 20.2 inches ;  $57.772 +$

.286 = 58.058, the content at 20.3 inches, &c. &c. until we have continued the process as far as we think necessary.—See the Key to this Work, where the above operation is continued to 25 inches; and hence we form the following Table Book.

A. B.'s CISTERN, No. 1, TABULATED.

Depth in Inches.	.0	.1	.2	.3	.4	.5	.6	.7	.8	.9
20	57.2	57.5	57.8	58.1	58.3	58.6	58.9	59.2	59.5	59.8
21	60.1	60.3	60.6	60.9	61.2	61.5	61.8	62.1	62.3	62.6
22	62.9	63.2	63.5	63.8	64.1	64.4	64.6	64.9	65.2	65.5
23	65.8	66.1	66.4	66.6	66.9	67.2	67.5	67.8	68.1	68.4
24	68.6	68.9	69.2	69.5	69.8	70.1	70.4	70.6	70.9	71.2
25	71.5	.....	.....	.....	.....	.....	.....	.....	.....	.....

In this manner the Table may be continued to the top of the cistern; and hence the content at any depth contained in the Table, may be found by inspection.

EXAM. 2.

The mean length of a Maltster's cistern is 128.6, the mean breadth 85.4, and the depth 52.8 inches; what is the area and content in malt bushels?

*Ans.* The area is 5.107, and the content 269.6496 malt bushels.

EXAM. 3.

How many bushels are contained in the cistern, the dimensions of which are given in the last Example, when the mean depth of the grain is 43.7 inches?

*Ans.* 223.1759 bushels.

## REMARK.

By Chap. 128, Sec. I., of a Statute made in the 52d year of the reign of George III., it is enacted that Maltsters shall construct their cisterns in such a manner that the Officers of the Excise shall be able conveniently to gauge, in any part of two sides, the corn or grain contained in such cisterns; and if the length or breadth of any cistern shall exceed 9 feet, then the Maltster shall provide a ladder and plank of sufficient length and strength, so that by laying the plank across the cistern, the Officer may be enabled to take gauges in any part thereof; and if any maker of malt shall neglect or refuse to comply with the provisions of this Act, he shall forfeit 200£.

## PROBLEM II.

*To gauge a couch of Malt contained in a rectangular frame.*

*Directions for taking the dimensions, &c.*

As a couch of malt in a rectangular frame, forms precisely the same figure of which we have treated in the last Problem, it is manifest that the dimensions, area, and content must be obtained in the same manner. It must be observed, however, that only the length, breadth, and area of a couch-frame appear in the Officer's Malt Book; but in gauging and fixing a cistern, both the length, breadth, area, and depth are always entered.

*Note 1.* Notwithstanding, a couch-frame may be said to be fixed, when the length, breadth, and area are entered at the top of the Malt Book; yet as the Traders sometimes make alterations, the dimensions of couch-frames ought frequently to be examined.

2. The readiest method of obtaining the mean depth of grain in a cistern, couch, or floor, is to choose some integral number, as a *supposed* mean depth, after having ascertained *nearly* what the mean depth will be, from your first or second depth; then, add together the number of *tenths* which each depth exceeds the *chosen number*; divide the sum by the number of depths; and the quotient being added to the *chosen number*, will give the true depth of the grain. Thus, let the *chosen number* or supposed mean depth of a couch of malt be 24 inches; and let five depths, taken in different places, be 24.3, 24.4, 24.7, 24.9, and

24.2; then we have  $(3 + 4 + 7 + 9 + 2) \div 5 = 25 \div 5 = .5$ ; hence  $24 + .5 = 24.5$  inches, the mean depth of the grain. The whole of this process may easily be performed mentally, as you take the respective depths; thus, 3 and 4 are 7; 7 and 7 are 14; 14 and 9 are 23; 23 and 2 are 25; then 5 in 25, five times, and nothing over; hence 24.5 inches is the depth required.

3. If any of the depths should be less than the *chosen number*, then the deficiency must be deducted from the sum of the tenths already obtained; thus, if the third depth had been 23.8, then 9 tenths must have been taken from 7 tenths; and the difference would have been 5 tenths, which must have been added to the 9 tenths in the fourth depth, &c. &c.

4. If the difference between the *chosen number* and any of the depths be an inch or upwards, it must be reduced into tenths; thus, suppose the difference to be 1.2; then this must be called 12 tenths, &c.

#### EXAMPLES.

1. The mean length of a couch-frame is 126, the mean breadth 112, and the mean depth of the grain 20.2 inches; required the content of the couch, in malt bushels.

#### BY THE SLIDING RULE.

<i>M. B.</i>	<i>Length.</i>	<i>Breadth.</i>	<i>Area.</i>
As 2150.42 on A :	126 on B :	112 on A :	6.56 on B.

*And,*

<i>Unity.</i>	<i>Area.</i>	<i>Depth.</i>	<i>Content.</i>
As 1 on A :	6.56 on B ::	20.2 on A :	132.5 on B.

*Or,*

<i>Length.</i>	<i>Depth.</i>	<i>Breadth.</i>	<i>Content.</i>
As 126 on B :	20.2 on M. D. ::	112 on A :	132.5 on B.

*Note.* The length and breadth of cisterns are always taken in inches and tenths; but the length and breadth of couch-frames, floors, and kilns, are only taken to the nearest whole inch. The depth of the grain, however, in all cases, is taken in inches and tenths.

2. The mean length of a couch-frame is 148, the mean breadth 125, and the mean depth of the grain 26.8 inches; required the area and content, in malt bushels.

*Ans.* The area is 8.602, and the content 230.5386 malt bushels.

3. How many bushels are contained in the couch-frame, the dimensions of which are given in the last Example, when the mean depth of the grain is 18.7 inches?

*Ans.* 160.8574 bushels.

### PROBLEM III.

*To gauge a couch of Malt, not in a frame, but laid upon the floor, in a square or rectangular form, with one or more of its sides slanting.*

*To take the dimensions, &c.*

Measure several lengths, from which find the mean length, as before directed. Find the mean breadth, and the mean depth in the same manner; then from these dimensions find the area and content as in the foregoing Problems.

*Note 1.* If both ends and sides of a couch of malt be slanted, the lengths and breadths must be taken in the following manner: Fix the tape at the innermost sloping edge of one end, by putting your dipping piece through the ring; then extend the tape, in a horizontal direction, to the outermost sloping edge of the opposite end of the couch, which may be found by dropping a few grains of corn; and you will thus have one length of the couch; for what is lost in the length at one end, will be obtained by extending the tape to the sloping extremity of the

other end. In the same manner, find several other lengths; taking care to fix the end of the tape alternately at the opposite ends of the couch, by which means, the necessary corrections will be made, when one end slants more than the other; and from these lengths determine the mean length as before directed.

2. If one end or one side only be sloped, and the other laid against an upright wall or partition, fix the end of the tape close to the wall by the assistance of the dipping piece, as before directed; and extend the tape, in a horizontal direction, over the surface of the grain, to the extremity of the opposite sloping edge; then return the tape to the inner extremity of the sloping edge; and the doubling of the tape will shew the length or breadth required.

#### EXAMPLES.

The mean length of a couch of malt with sloping ends and sides, is found to be 96, the mean breadth 84, and the mean depth 22.8 inches; required the area and content in malt bushels.

*Note.* The above perpendicular section shows the two sloping ends A B and C D of the couch. The line C m denotes the rod or dipping piece placed at the inner extremity of the slanting end C D; the line C E represents the tape extended from C to the outer extremity of the slanting end A B; consequently, C E denotes one length of the couch, obtained in the manner directed in the first Note.

#### BY THE PEN.

*To find the area and content.*

Here  $96 \times 84 \div 2150.42 = 8064 \div 2150.42 = 3.749$ , the area of the couch; and  $3.749 \times 22.8 = 85.4772$ , the content in malt bushels.

#### BY THE SLIDING RULE.

<i>Length.</i>	<i>Depth.</i>	<i>Breadth.</i>	<i>Content.</i>
As 96 on B	: 22.8 on M. D.	:: 84 on A	: 85.47 on B.

2. The mean length of a couch of malt with one end and one side slanting, (the other being placed against two upright walls,) is found to be 138, the mean breadth 113, and the mean depth 28.6 inches; required the area and content in malt bushels.

*Ans.* The area is 7.251, and the content 207.8786 malt bushels.

*Note 1.* The above perpendicular section exhibits one slanting and one perpendicular end of the couch. The line C F represents the tape extended from C to the outer extremity of the slanting end A B; B E denotes the tape returned or doubled back from F to B; hence the line C E represents one length of the couch, found as directed in the second Note.

2. The foregoing method of gauging malt, may be well applied in taking malt-stocks, when an increase or decrease of duty takes place.

### PROBLEM IV.

*To gauge a couch of Malt either in the form of a cone, or a conical frustum.*

*To find the content of a cone of Malt.*

### RULE.

#### BY THE PEN.

Multiply the square of the mean diameter of the base by the perpendicular height; divide  $\frac{1}{3}$  of the product by 2738; and the quotient will be the content in malt bushels.

#### BY THE SLIDING RULE.

As 52.32 on D, is to one-third of the perpendicular altitude on C; so is the mean diameter on D, to the content on C.

and B E are equal to each other, and also equal to the perpendicular height C m; and in this manner, the dimensions of any conical heap of grain may be obtained.

## BY THE PEN.

*To find the content.*

Here  $(138 \times 138 \times 47.3) \div 3 = (19044 \times 47.3) \div 3 = 900781.2 \div 3 = 300260.4$ ; and  $300260.4 \div 2738 = 109.664$ , the content in malt bushels.

## BY THE SLIDING RULE.

On D.	On C.	On D.	On C.
As 52.32	: 15.8	:: 138	: 109.66 content.

2. The mean diameter of the base of a conical frustum of malt, is 144, the mean diameter of the top 64, and the perpendicular height 28.2 inches; required the content in malt bushels, when the figure is reduced to a cylinder.

*Ans. 111.399 bushels.*

## REMARK.

In order to have a check upon the method of gauging malt when in the form of a cone or a conical frustum, we first gauged a couch of malt in a rectangular frame; we then had it thrown out, and formed it into a conical shape; and after taking the dimensions and casting the content, with the greatest accuracy, we found that the gauge was a little by about 6 bushels. This being the case, we found it necessary to increase the dimensions a little, by measuring to the very extremities of the base and top; and the dimensions thus taken are given in the first example.

We then formed the heap of grain into a conical frustum levelling its top. This operation of course increased the mean diameter a little; but notwithstanding this, the content obtained from the dimensions of the frustum reduced to a cylinder, was some bushels too little; hence we found it necessary again to increase the dimensions. The increased dimensions are given in the second Example;

and the content obtained from these dimensions is precisely the same as that found when the grain was gauged in a couch-frame.

The reason why the contents found from the *true* dimensions of the cone and the conical frustum, were less than the content found from the dimensions taken in the couch frame, appeared evident; for, notwithstanding we took considerable pains in shaping the cone and frustum, yet their sides always formed curved lines, instead of straight lines, in consequence of the grains of corn adhering to each other; hence it is manifest that the contents of cones and conical frustums of malt will always be too little, when found from the true dimensions; because those dimensions will only give the true contents, when the sides of the figures are straight from the top to the bottom. (See the Definitions of the Cylinder and Cone, Part V.)

- . *Note.* From the foregoing observations, it appears evident that couch-frames ought always to be used, in order to obtain the true content of grain making into malt; for all gauges taken of grain not inclosed in frames, are more or less liable to error.

## PROBLEM V.

*To gauge a rectangular floor of Malt.*

*Directions for taking the dimensions, &c.*

Find the mean length, breadth, and depth, as directed in Problem III.; and from these dimensions, find the area and content, as directed in the first Problem of this Section. Or, multiply the length, breadth, and depth continually together; divide the last product by 2150.42, and the quotient will be the content in malt bushels.

### BY THE SLIDING RULE.

As the length on B, is to the depth on M D; so is the breadth on A, to the content on B. Or, as the breadth on B, is to the depth on M D; so is the length on A, to the content on B.

*Note 1.* In Practice, the contents of small floors of malt may always be determined by the *Sliding Rule*; but when a floor exceeds 200 bushels, then the *Pen* ought invariably to be used; because the tenths from 2 to 5, on the lines A and B, are only divided into two parts each; but those from 1 to 2, are each divided into five parts; hence the content of a floor may be pretty correctly estimated by the *Sliding Rule*, when it is under 200 bushels. It may also be observed that *floor-charges* must always be cast by the *Pen*, whatever be their contents.

2. The breadths of malt-floors, are generally fixed dimensions; and should be placed upon some conspicuous part of the malt-house.

## EXAMPLES.

1. The mean length of a floor of malt is 329, the mean breadth 242, and the mean depth of the grain 5.6 inches; required the content in malt bushels.

*Divisor 2150.42) 445860.8 (207.33 content.*

## BY THE SLIDING RULE.

<i>Length.</i>	<i>Depth.</i>	<i>Breadth.</i>	<i>Content:</i>
As 329 on B	: 5.6 on M. D	:: 242 on A	: 207.3 on B.

Or,

<i>Breadth.</i>	<i>Depth.</i>	<i>Length.</i>	<i>Content.</i>
As 242 on B	: 5.6 on M. D	:: 329 on A	: 207.3 on B.

*Note.* Some experienced Officers think the latter method of casting the content by the *Sliding Rule* is more convenient than the former; it is best, however, to cast the contents of all floors by both methods; be-

cause one method then serves as a proof for the other ; consequently, any error committed in the first operation will be detected in the second.

2. The mean length of a floor of malt is 435, the mean breadth 218, and the mean depth of the grain 5.2 inches ; required the content in malt bushels.

*Ans. 229.311 bushels.*

3. The length, breadth, and depth of a floor of malt measure 485, 224, and 3.4 inches respectively ; what is the content in malt bushels ?

*Ans. 171.769 bushels.*

### PROBLEM VI.

*To find the content of a rectangular floor of Malt by another method.*

#### RULE.

Multiply the length of the floor by half the breadth, or the breadth by half the length ; and point off three figures as decimals. Then multiply the number thus obtained by the depth ; and this product by .93 ; and you will obtain the content of the floor, in malt bushels.

*Note 1.* If the length of a floor be multiplied by half the breadth, or the breadth by half the length, and this product by the depth ; the last product will give the content of the floor 7 bushels too much, in every hundred ; care however must be taken to point off three figures, as decimals, before you multiply by the depth. Thus it appears that the *true* content may also be obtained by subtraction ; for, if the *false* content be multiplied by 7 ; the product divided by 100 ; and the quotient subtracted from the *false* content, the remainder will be the *true* content of the floor.

2. If the malt divisor had been 2000, the length multiplied by half the breadth, and three figures pointed off, as decimals, would have given the true area of the floor ; for this process is, in effect, the same as dividing the product of the length and breadth by 2000 ; but as the malt divisor is 2150.42, it is evident that the above method will always give the area too much ; hence the necessity of the deduction mentioned in the first Note.

3. If either the length or breadth of a floor be 215 inches, then the other dimension will be the area of the floor, when one figure is pointed off as a decimal ; consequently, if this area be multiplied by the depth, the product will be the *true* content of the floor, in malt bushels.

4. When half the length or half the breadth of a floor of malt, is 120, 110, 100, 90, 80, &c. &c. the product of the other dimension and any of these numbers may easily be obtained *mentally*; then three figures being cut off, as decimals, the remainder may also be multiplied by the depth; and thus you will obtain the *false* content of the floor. Lastly, multiply this content by 7; cut off two figures for decimals; subtract the remainder from the *false* content; and you will obtain the *true* content of the floor, without using either the Pen or the Sliding Rule.

## EXAMPLES.

1. The length of a rectangular floor of malt is 329, the breadth 242, and the depth 5.6 inches; required the content in malt bushels.

## BY THE RULE.

*Inches.*

329 *length.*

## BY THE FIRST NOTE.

Here  $329 \times 121 \times 5.6 = 222.930$  *the false content.*

And  $\frac{222.93 \times 7}{100} = \frac{1560.51}{100} = 15.605$  *the deduction.*

207.325 *the true content.*

2. The length of a floor of malt is 435, the breadth 218, and the depth 5.2 inches ; what is the content in malt bushels ? *Ans. 229.298 bushels.*

3. The length of a floor of malt is 215, the breadth 186, and the depth 6.7 inches ; required the content in malt bushels. *Ans. 124.62 bushels.*

4. The length of a floor of malt is 250, its breadth 100, and its depth 6 inches ; it is required to determine its content *mentally.* *Ans. 69.75 bushels, nearly.*

#### REMARK.

The methods given in the last Problem, for finding the content of a floor of malt, are extremely simple ; and may be of considerable service to young Officers, as a *check*, in making compares with preceding gauges, when a floor is found very irregular in its dimensions. This compare ought to be made before the dimensions of the floor are entered in the Malt Book ; and if any error has been committed, it must be immediately rectified, by re-taking the dimensions with greater accuracy.

#### PROBLEM VII.

*To gauge and fix a rectangular Malt-kiln.*

*Directions for taking the dimensions, &c.*

Find the mean length and breadth of the kiln, as before directed ; then, multiply the length by the breadth ; divide the product by 2150.42 ; and the quotient will be the area in malt bushels. Multiply this area by the depth of the grain, and the product will be the content.

#### BY THE SLIDING RULE.

As 2150.42 on A, is to the length on B ; so is the breadth on A, to the area on B ; and as unity on A, is to the area on B ; so is the depth on A, to the content on B.

*Note 1.* The entrance to a malt-kiln is generally from an adjoining room ; sometimes, however, the well-hole of the stairs which lead to

the kiln, forms an opening or aperture in a corner of the kiln-floor; in this case, either the area of the well-hole must be deducted; or which is better, divide the area of the well-hole by the breadth of the kiln; deduct the quotient from the length; and the remainder will be the true length required. This Rule is formed on the well-known principle, that the area of a rectangle divided by one of its dimensions, will give the other dimension. One of the dimensions of the copper-back, in Prob. IV., Sect. II., might have been reduced in this manner.

2. It is scarcely necessary to observe that malt should be in a *row* state, or nearly so, when gauged on the kiln, or the content cannot be expected to compare well with the preceding gauges.

3. The lengths and breadths of malt-kiln floors, are fixed dimensions; and should be placed in some conspicuous part of malt-kilns. The dimensions and area must also be entered at the top of the malt book.

#### EXAMPLES.

1. The length of a rectangular malt-kiln is 212, and its breadth 203 inches; required the area in malt bushels.

#### BY THE PEN.

424

*Area.*

*Divisor 2150.42) 43036.00 (20.012 bushels.*

#### BY THE SLIDING RULE.

*M. B.            Length.    Breadth.    Area.*

*As 2150.42 on A : 212 on B :: 203 on A : 20.01 on B.*

2. If the depth of the grain on the kiln; the dimensions of which are given in the above Example, be 4.7 inches; required the content in malt bushels.

*Ans. 94.0564 bushels.*

3. The length of a rectangular malt-kiln is 236, and its breadth 212 inches; the length of the well-hole for the stairs is 50, and its breadth 30 inches; required the true

Q q

length of the kiln, so as to make a deduction for the well-hole ; and also the area in malt bushels.

*Ans.* The true length is 229 inches ; and the area 22.576 malt bushels.

#### REMARK.

The areas or contents of any figures not treated of in the preceding Problems, may be found by the respective Problems in Parts IV., or V. ; and should a cistern be met with in the form of the frustum of a cone or pyramid, it must be gauged as directed in the first Section of Part VI.

### PROBLEM VIII.

*To find whether the duty will arise from the cistern, the couch, or the floor.*

#### RULE.

The duty is always charged upon the *best gauge* of the cistern, couch, or floor ; and in order to find from which of these the charge will arise, without reducing them to *net bushels*, proceed thus : Multiply the best gauge of the cistern or couch by 1.6 ; and if the product exceed the floor bushels, the charge must be made from the cistern or couch ; but if not, the charge must be made from the floor.

*Note 1.* If cistern or couch bushels be multiplied by .8, the product will be net bushels ; but floor bushels must be multiplied by .5, in order to reduce them to net bushels. (See Preliminary Observations.)

2. If floor bushels be multiplied by .625, the product will be cistern or couch bushels.

3. The above factors are obtained by the following Proportions :

As {  $20 : 16 :: 1 : .8$ , for reducing cistern or couch bushels to net bushels.  
 $20 : 10 :: 1 : .5$  for reducing floor bushels to net bushels.  
 $.5 : .8 :: 1 : 1.6$  for reducing cistern or couch bushels to floor bushels.  
 $.8 : .5 :: 1 : .625$  for reducing floor bushels to cistern or couch bushels.

4. When barley is much damaged, it loses part of its vegetative quality. Under such a circumstance, the best floor-gauge will some-

times not advance much more than one-fifth above the dry barley. When this is the case, the reason ought to be assigned in the Malt Book.

## EXAMPLES.

1. The best cistern-gauge is 129.6, the best couch-gauge 132.5, and the best floor-gauge 207.3 bushels; from which of these gauges will the charge of the duty arise; and what are the number of net bushels?

$$\begin{array}{r}
 \text{Bushels.} \\
 132.5 \text{ couch-gauge.} \\
 1.6 \text{ multiplier.} \\
 \hline
 7950 \\
 1325 \\
 \hline
 212.00 \text{ product.} \\
 \hline
 \hline
 \end{array}$$

Here the number of bushels obtained by multiplying the couch-gauge by 1.6, exceeds the number of floor-bushels; hence the charge will arise from the couch.

$$\begin{array}{r}
 \text{Bushels.} \\
 132.5 \text{ couch bushels.} \\
 .8 \text{ multiplier.} \\
 \hline
 86.00 \text{ product.} \\
 \hline
 \hline
 \end{array}$$

Here the net bushels are 86, the number upon which the duty must be charged.

2. If the best cistern-gauge be 68.4, the best couch-gauge 69.8, and the best floor-gauge 112.6 bushels; from which will the charge of the duty arise; and what are the number of net bushels?

*Ans.* The charge of the duty will arise from the floor; and 56.3 are the net bushels upon which the duty must be charged.

*Note.* Here it may be proper to observe that the malt-duty is always charged upon the net bushels and tenths of a bushel; and when the second place of decimals is five or above, the first is called one more; but when the second place is under five it is rejected.

**A SPECIMEN OF A DIMENSION BOOK,**  
*Containing the Dimensions and Contents of all the Casks  
 given in Problems III., IV., V., and VI., of Cask  
 Gauging.*

$\frac{d}{N}$	V.	H.	B.	L.	Con.	$\frac{d}{N}$	V.	H.	B.	L.	Con.

## SECTION V.

THE METHOD OF GAUGING AND INCHING DISTILLERS'  
UTENSILS, AS PRACTISED IN THE EXCISE.

---

*DISTILLERY.*

## PRELIMINARY OBSERVATIONS.

IT being a duty incumbent upon Officers of the Excise to do the utmost justice between the Revenue and the Trader, they ought, on all occasions, to take the dimensions, and find the areas and contents of the vessels they gauge, with the greatest accuracy. If this be necessary in the ordinary course of business, it is still more so, when an Officer has to gauge and inch the Utensils of Distillers; because the duty on a gallon of Spirits, is high when compared with that on a gallon of Ale; hence, small errors in the dimensions, areas, or contents of Stills, Wash-backs, Jack-backs, &c. will, by a constant repetition, lead to very serious results.

Some Writers on Gauging affect to divide Stills into different mathematical figures, and find their contents accordingly; thus, the upper part of a Still they suppose to form the frustum of a sphere; the middle part the frustum of a spheroid; and the bottom they take as the segment of a sphere; but it is more than probable that there never was any Still made, the parts of which exactly corresponded to these figures; consequently, this method of Gauging must be subject to considerable inaccuracy.

We have no hesitation in saying that the same method we have adopted in Gauging Coppers, may be equally well applied in Gauging Stills ; and will be found much more *accurate* and *practical* than the *abstruse* method of dividing them into different Parts, without any possibility of proving the existence of those Parts, either by comparison or by Mathematical Rules.

Still-heads are also divided, by the same Writers, into various mathematical figures ; namely, the upper and lower parts are considered to form spherical frustums, and the middle part is taken as the middle frustum of a spheroid ; but we object to this method of division, on the same grounds as we do to that of the Still. The content of a Still-head, at every inch of its perpendicular depth is never wanted, but merely the content of the whole head ; hence, we are of opinion that a more *accurate* and *practical* Rule cannot be devised than that which we have given in Prob. XX., Part V.

We also conceive that the method of Gauging oval Wash-backs, and Jack-backs, by means of equidistant ordinates, is very imperfectly treated by most Writers on Gauging ; as they have neither elucidated the Rules, nor applied them to Practice, in such a manner as to be comprehended by the generality of Readers. We trust that the Rules, Remarks, and Examples we have given in Prob. XX., Part IV., together with their Practical Application in this Section, will give general satisfaction, not only to Masters of Seminaries, but also to Officers of the Excise.

## PROBLEM I.

*To gauge and inch a Wash-Still.*

### EXAMPLES.

#### EXAM. 1.

Let the following figure A B C D represent a Wash-Still ; it is required to gauge and inch it, for dry inches, as practised in the Excise.

*To take the dimensions.*

Lay a straight rod diametrically across the top of the Still; let fall a plumb-line from the middle of the rod at E, to the centre of the crown at G; measure  $EG = 61$ ; also measure  $EF = 5$ ; then  $61 - 5 = 56$  inches =  $FG$ , the depth to be tabulated.

Next, measure the diameter  $AB = 28$ ; quarter the top of the Still; place a lighted candle upon the centre of the crown at G; suspend a plumb-line successively from the four quartering points; darken the top of the Still; and trace the quartering lines down its sides by the shadow of the plumb-line.

Lastly, measure cross diameters in the middle of every 4, 6, or 8 inches; from these cross diameters find mean diameters; and enter all the dimensions in a Note Book, as directed for the copper, in Prob. II., Sect. II., Part VI.

## NOTE BOOK.

*To find the area and content.*

## RULE.

Find the area corresponding to each mean diameter, in the Table of *Wine Areas*, Part VII.; then multiply each area by its respective depth; and the sum of the products will be the whole content of the Still.

*Note.* The content of the liquor to cover the crown, may be found by any of the Rules given in Prob. II., Sect. II., Part VI.

## DIMENSION BOOK.

Having found the areas of the several Sections, and the contents of the different Divisions, we hence form the Dimension Book as follows.

A. B.'s Wash-Still, No. 1, gauged Dec. 8th, 1821.				
Divisions in Inches.	Depths from the Top.	Mean Dia-meters.	Areas in Gallons.	Contents in Gallons.
4	2	38.0	4.910	19.640
4	6	46.4	7.320	29.280
4	10	53.6	9.768	39.072

6	47	58.2	11.517	69.102
6	53	54.0	9.914	59.484
56	Depth. Crown per Meas.			22.000
Whole Content.				644.698

*To tabulate the foregoing Wash-Still for Dry Inches.*

### RULE.

From the whole content in wine gallons, subtract the area of the first Section ; and the remainder will be the content, when one inch is dry. From this remainder, subtract the same area, and you will obtain the content when two inches are dry. Proceed in this manner until you have tabulated the whole Still ; taking care to change the area when you arrive at 4 inches, at 8 inches, at 12 inches, at 20 inches, &c. of the perpendicular depth of the Still, as in the following Table.

**A TABLE,**  
*Shewing the Method of Inching the foregoing Wash-Still.*

Dry Inches.	Contents in Gallons.	Dry Inches.	Contents in Gallons.	Dry Inches.	Contents in Gallons.	Dry Inches.	Contents in Gallons.
Full	644.698 4.910	6	610.418 7.320	12	556.706 11.636	18	486.890 11.636
1	639.788 4.910	7	603.098 7.320	13	545.070 11.636	19	475.254 11.636
2	634.878 4.910	8	595.778 9.768	14	533.434 11.636	20	463.618 12.818
3	629.968 4.910	9	586.010 9.768	15	521.798 11.636	21	450.800 12.818
4	625.058 7.320	10	576.242 9.768	16	510.162 11.636	22	437.982 12.818
5	617.738 7.320	11	566.474 9.768	17	498.526 11.636	23	425.164 12.818

In this manner we may obtain the content of the Still at every *dry* inch of its perpendicular depth ; and, by way of Practice, the Learner is required to continue the above process. (See the Key to this Work.)

*To form a Distiller's Table Book, &c.*

The gauge of Wash is taken through a cylindrical tube fixed in the breast of the Still, and rising 3 or 4 inches above the base of the collar, where the tabulating commences ; consequently, in forming the Table Book, we must not begin at the base of the collar, as in the foregoing Table, but as many inches above it as the top of the tube exceeds it in height. Thus, if the top of the tube rises 4 inches above the base of the collar, or diameter A B ; then the Still will be full when the gauge exhibits 4 dry inches, &c. &c. as in the following Table Book.

## A DISTILLER'S TABLE BOOK.

<i>A. B.'s Wash-Still, No. 1.</i>							
Dry In- ches.	Contents in Gallons.	Dry In- ches.	Contents in Gallons.	Dry In- ches.	Contents in Gallons.	Dry In- ches.	Contents in Gallons.
4	645	10	610	16	557	22	487
5	640	11	603	17	545	23	475
6	635	12	596	18	533	24	464
7	630	13	586	19	522	25	451
8	625	14	576	20	510	26	438
9	618	15	566	21	499	27	425

In this manner the Table Book may be completed ; and by way of Practice, the Learner is required to continue the above process.

*Note.* In forming the above Table Book, the first decimal place is rejected when it is under five-tenths ; but when it is five-tenths or above, it is called one gallon.

## REMARK.

If we consider the upper part  $ABcc$ , of the foregoing Still, to represent the frustum of a sphere, then we have the diameter  $AB = 28$ , the diameter  $cc = 53.6$ , and the perpendicular height  $= 10$  inches ; hence, by Prob. XII., Part V., we find the content to be 64.434 wine gallons.

Again, taking the middle part  $ccrr$  as the frustum of a spheroid, we have the diameter  $cc = 53.6$ , and the diameter  $rr = 52.4$  ; consequently  $\frac{53.6 + 52.4}{2} = \frac{106}{2} = 53$ , the mean end diameter. The perpendicular altitude is 46 ; and the middle diameter is found to be 62.5 inches ; hence, by Prob. XIV., Part V., we find the content to be 553.729 wine gallons.

The quantity of liquor necessary to cover the crown, is found by measure, to be 22 gallons ; hence, we have  $553.729 + 64.434 + 22.0 = 640.163$  gallons, the whole

content, which is 4.535 gallons less than the content given in the foregoing Dimension Book. This difference arises chiefly in consequence of the upper part of the Still being rather larger than the frustum of a sphere; hence it appears that the foregoing method of *tabulating* a Still is more accurate than the following one; which is likewise so very tedious and complex, that it is almost impracticable. (See Prob. XV., Sect. I., Part VI.)

*Note.* By Rule 2, Prob. II., Sect. II., Part VI., the content of the liquor necessary to cover the crown, is found to be  $24\frac{1}{2}$  gallons, which is too much by  $2\frac{1}{4}$  gallons.

*The Method of Tabulating the foregoing Still, when the upper part is considered as the frustum of a Sphere.*

In order to make the foregoing dimensions answer our purpose, we shall take the altitude of the globular part = 12 inches; then we have the top diameter = 28 inches, and the bottom diameter = 55.6 inches; hence, by Prob. XV., Sect. I., Part VI., we find the first intermediate diameter to be 31.9, the second 35.3, the third 38.3, the fourth 41.0, the fifth 43.4, the sixth 45.6, the seventh 47.6, the eighth 49.5, the ninth 51.2, the tenth 52.8, and the eleventh 54.2 inches. (See Exam. 3, of the Prob. to which we last referred.)

Now, in order to find the mean diameters in the middle of every inch, we must divide the sum of the diameters at the extremities of each inch, by two; and the quotients will be the diameters by which the globular part of the Still must be *tabulated*. These diameters and the areas corresponding to them, are exhibited in the next page.

<i>In.</i>	<i>In.</i>	<i>In.</i>	<i>Diam.</i>	<i>Areas.</i>
$\frac{28.0 + 31.9}{2}$	$= \frac{59.9}{2}$	$= 29.9$	.....	3.040
$\frac{31.9 + 35.3}{2}$	$= \frac{67.2}{2}$	$= 33.6$	.....	3.838
$\frac{35.3 + 38.8}{2}$	$= \frac{78.6}{2}$	$= 36.8$	.....	4.604
$\frac{38.8 + 41.0}{2}$	$= \frac{79.3}{2}$	$= 39.6$	.....	5.332
$\frac{41.0 + 43.4}{2}$	$= \frac{84.4}{2}$	$= 42.2$	.....	6.055
$\frac{43.4 + 45.6}{2}$	$= \frac{89.0}{2}$	$= 44.5$	.....	6.733
$\frac{45.6 + 47.6}{2}$	$= \frac{93.2}{2}$	$= 46.6$	.....	7.383
$\frac{47.6 + 49.5}{2}$	$= \frac{97.1}{2}$	$= 48.5$	.....	7.998
$\frac{49.5 + 51.2}{2}$	$= \frac{100.7}{2}$	$= 50.3$	.....	8.602
$\frac{51.2 + 52.8}{2}$	$= \frac{104.0}{2}$	$= 52.0$	.....	9.194
$\frac{52.8 + 54.2}{2}$	$= \frac{107.0}{2}$	$= 53.5$	.....	9.732
$\frac{54.2 + 55.6}{2}$	$= \frac{109.8}{2}$	$= 54.9$	.....	10.248

*Whole content of the spherical frustum* 82.759

*Note 1.* In finding the foregoing diameters, the second figure of decimals is neglected; and in taking the areas from the Table, the third figure of decimals is called one more, when the fourth figure is found to be five or upwards.

2. The content of the globular part of the foregoing Still, found by Prob. XII., Part V., is 82.97 wine gallons, which agrees well with the content found from the mean diameters; but if we add together the contents of the first three divisions, in the foregoing Dimension Book, we obtain 87.992 gallons, which proves that the upper part of the Still is greater than a spherical frustum.

R r

*To tabulate the Still for dry inches.*

### RULE.

The whole content of the Still, as given in the Dimension Book, is 644.698, from which take 87.992, the content of the first three divisions; and we obtain 556.706, the content of the remainder of the Still. To this number add 82.759, and we have 639.465 wine gallons, the content of the Still, when the upper part is taken as the frustum of a sphere. Thus having found the areas of the different sections of the globular part, and the whole content, we proceed to tabulate the first 12 inches of the Still. We then take the areas 11.636, 12.818, &c. &c. from the Dimension Book, and continue the tabulation, as in the following Table.

### A TABLE

*Shewing the Method of Inching the foregoing Still, when the upper part is considered as the frustum of a Sphere.*

Dry Inches.	Contents in Gallons.	Dry Inches.	Contents in Gallons.	Dry Inches.	Contents in Gallons.	Dry Inches.	Contents in Gallons.
Full	639.465 3.040	6	609.863 7.388	12	556.706 11.636	18	486.800 11.636
1	636.425 3.888	7	602.480 7.998	13	545.070 11.636	19	475.254 11.636
2	632.587 4.604	8	594.482 8.602	14	533.434 11.636	20	463.618 12.818
3	627.983 5.332	9	585.880 9.194	15	521.798 11.636	21	450.800
4	622.651 6.055	10	576.686 9.732	16	510.162 11.636		
5	616.526 6.738	11	566.954 10.248	17	498.526 11.636		

In this manner the content of the Still may be found at every *dry* inch of its depth; and the Learner is required to continue the above process. (See the Key to this Work.)

*To make deductions for Spindles, Cross-Bars, Braces, Chains, and other Impediments contained in a Still.*

A large Still has generally a wooden spindle extending perpendicularly from its mouth to within three or four inches of the top of the crown. This spindle is supported by cross-bars and braces; chains are attached to it, in different places; and during the time the liquor is boiling, the spindle and chains are made to perform a rotary motion, either by the hand, or by machinery. By this means the *wash* is *rouned*, and the sediment prevented from settling to the bottom, where it would become burnt; and thus impart an unpleasant flavour to the spirits.

Suppose a spindle extends from the top of the Still, given in the following Example, to within 8 inches of the crown; passing through an iron bar, placed across the Still, at 32 inches from the top; and let the circumference of the spindle be 9.5 inches; then its diameter will be 3 inches, and its area .08 of a wine gallon. Also, let the length of the cross-bar be 87 inches, its breadth 5 inches, and its depth 4 inches; then  $87 \times 5 \div 231 = 435 \div 231 = 1.88$  wine gallons, the area of the cross-bar.

Now, it is evident before we can tabulate the Still correctly, we must deduct the area of the spindle from each area of the Still that is affected by it; and the area of the cross-bar must also be deducted from that part of the Still where it is placed; namely, from the area used in tabulating the Still from 32 to 36 inches of its depth, because the depth of the bar is 4 inches.

The contents of the *chains* must be found by any practical method, and deducted from the quantity of liquor necessary to cover the crown of the Still; the tabulation may then be performed as before directed.

*Note.* The most correct method of finding the content of any very irregular body, is to immerse it in a cylindrical vessel of water; then take it out, and find the content of that part of the vessel through which the water has descended, by removing the irregular body; and it will be the content required.

## EXAM. 2.

The dimensions, areas, and deductions of a Still, are contained in the following Dimension Book; it is required to tabulate the vessel for dry inches, as practised in the Excise.

## DIMENSION BOOK.

A. B.'s Wash-Still, No. 2, gauged Dec. 18th, 1821.							
Divisions in Inches.	Depths from the Top.	Mean Dia- meters.	Cross Areas.	Impediments.		Net Areas.	Contents in Gallons.

## A TABLE

*Shewing the Method of Tabulating the Still given in the foregoing Example.*

Dry In- ches.	Contents in Gallons.	Dry In- ches.	Contents in Gallons.	Dry In- ches.	Contents in Gallons.	Dry In- ches.	Contents in Gallons.
Full	1549.53 7.74	4	1518.57 10.33	8	1477.25 13.59	12	1432.89 17.79
1	1541.79 7.74	5	1508.24 10.33	9	1463.66 13.59	13	1405.10 17.79
2	1534.05 7.74	6	1497.91 10.33	10	1450.07 13.59	14	1387.31 17.79
3	1526.31 7.74	7	1487.58 10.33	11	1436.48 13.59	15	1369.52 17.79

In this manner the content of the Still may be found at every *dry* inch ; and the Learner is required to continue the above process. (See the Key to this Work.)

*Note.* It may perhaps be necessary to remind the young Reader that in tabling this Still, the depths in the fifth, and the areas in the seventh column of the Dimension Book, are used, in consequence of the deductions that are made for the impediments.

## PROBLEM II.

*To find the content of a Still-Head.*

*To take the dimensions.*

Measure the depth from the upper part of the head to the bottom of the collar, from which deduct the depth of the collar ; and the remainder will be the depth of the head. Find mean diameters at the top, bottom, middle, and at one-fourth, and three-fourths of the depths of the head ; and enter all the dimensions in your Note Book.

*To find the content.*

## RULE.

Find the area corresponding to each diameter, in the Table of Wine Areas ; then to the sum of the areas of the top and bottom, add twice the area of the middle, and four times the sum of the areas at one-fourth and three-fourths of the depth ; multiply this sum by the depth ; divide the product by 12, and the quotient will be the content in wine gallons. (See Prob. XX., Part V.)

By Prob. IV., Part V., find the content of the cylindrical collar, which add to the content of the head ; and you will obtain the whole content required.

*Note.* By Act of Parliament, Distillers are not allowed to charge their Stills with a less proportion of wash, at one time, than three-fourths of the whole content of the Still and head ; and immediately before the wash is conveyed to the Still, it is always gauged in a circular or an elliptical vessel, kept expressly for that purpose ; and called a Jack-Back.

## EXAMPLES.

## EXAM. 1.

Let the following figure represent the head of the Wash-Still, given in the first Example of the last Problem; and let the depth  $m n = 34$ , the depth of the collar  $n r = 5$ , the diameter  $A B = 24.6$ ,  $a a = 41.2$ ,  $b b = 46.0$ ,  $c c = 41.6$ ; and  $C D = 27.7$  inches; required the content of the head and collar, in wine gallons.

*A. B.'s Wash-Still Head, gauged Dec. 8th, 1821.*

Inches from the Top.	Mean Diameters.		Areas in Wine Gallons.
0.0	A B	24.6	2.058
8.5	a a	41.2	5.771
17.0	b b	46.0	7.194
25.5	c c	41.6	5.884
34.0	C D	27.7	2.609
Collar's height 5, and diam. 27.7 inches.			

*To find the content.*

Here  $2.058 + 2.609 = 4.667$ , the sum of the top and bottom areas ; also,  $7.194 \times 2 = 14.388$ , twice the area of the middle section ; and  $5.771 + 5.884 \times 4 = 11.655 \times 4 = 46.62$ , four times the sum of the areas at one-fourth and three-fourths of the depth ; then,  $(4.667 + 14.388 + 46.62)$

$$\times \frac{1}{4} = \frac{65.675 \times 34}{12} = \frac{2232.950}{12} = 186.079 \text{ wine gal-}$$

lons, the content of the head.

Again,  $2.609 \times 5 = 13.045$  wine gallons, the content of the cylindrical collar ; then,  $186.079 + 13.045 = 199.124$  wine gallons, the whole content required.

Note 1. The content of the Still is 644.698 gallons, to which add 199.124, and we obtain 843.822 gallons, the content of the Still and Head. Three-fourths of this content is 632.866 gallons, the least quantity of wash with which the Still must be charged at one time.

2. Some writers on Gauging consider the parts A B a a, and C D c c, as the frustums of spheres ; and the part a a c c as the middle frustum of a spheroid ; but this method will never give the true content unless the head is actually composed of these figures, which is perhaps never the case ; hence, we recommend the *simple* Rule given in this Problem.

3. If a Still-Head be very large, so that five diameters are considered too few, then the content may be obtained by Problem XXI., Part V.

#### EXAM. 2.

The dimensions of the Still-Head, belonging to the Still given in the second Example of the last Problem, are contained in the following Dimension Book ; required the content of the head and collar, in wine gallons. (*See the last Fig.*)

#### DIMENSION BOOK.

A. B.'s Wash-Still Head, gauged Dec. 18th, 1821.			
Inches from the Top.	Mean Diameters.		Areas in Wine Gallons.
0.0	A B	27.2	2.515
10.0	a a	44.4	6.703
20.0	b b	51.0	8.843
30.0	c c	48.1	7.866
40.0	C D	35.4	4.261
Collar's height 6.2, diam. 35.4 inches.			

*Ans. The content is 302.211 wine gallons.*

*Note.* The content of the Still is 1549.53, to which add 302.211, and we obtain 1851.741 gallons, the content of the Still and Head. Three-fourths of this content is 1388.805 gallons, the least quantity of wash with which the Still must be charged at one time.

### PROBLEM III.

*To gauge and inch a Distiller's oval Wash-Back, by the method of equidistant ordinates.*

*Directions for taking the dimensions.*

By Prob. XX., Part IV., find the transverse and conjugate diameters of the base of the Wash-Back; and also double ordinates, at equal distances from each other; all of which must be struck with a chalk-line.

By Prob. III., Part V., set off, upon the sides of the vessel, at the ends of the double ordinates, the perpendicular distances that the horizontal sections are intended to be taken from each other; then measure the transverse and conjugate diameters, and also the double ordinates of each section; and enter all the dimensions in a Note Book.

*Note 1.* When a Wash-Back stands upon its greater base, the distance between the two extreme ordinates of the first horizontal section, must be somewhat less than the transverse diameter of the top, in order that all the dimensions of the uppermost section may fall within the vessel.

2. Horizontal sections must be taken in the middle of every 6, 8, or 10 inches, as the case may require.

*To find the area and content.*

### RULE.

By Prob. XX., Part IV., find the area of each horizontal section; then multiply each area by its corresponding depth; and the sum of the products will be the whole content. The vessel must then be tabulated for wet inches, by adding the area of the first section to itself, &c. &c. as before directed. (See Prob. I., Sec. II., Part VI.)

*Note 1.* The area of the segments may be most easily found by the latter part of Note 3, Prob. XX., Part IV.

2. The content of the drip, if any; and also the dipping-place, must be found as directed in Prob. IX., Sect. II., Part VI.

## EXAMPLES.

## EXAM. I.

The dimensions of a Distiller's oval Wash-Back, are contained in the following Dimension Book ; it is required to tabulate the vessel for wet inches, as practised in the Excise.

# DIMENSION BOOK.

A. B.'s Wash-Back, No. 1, gauged January 28th, 1822.														
9 Ordinates, 12 inches equidistant = 96 inches.														
Divisions in Inches.	Depths from the Bottom.	Transverse Diam.	1	2	3	4	Conj. 5 Diam.	6	7	8	9	Sum of the Segs.	Total Areas.	Contents in Gallons.
10	35	100.0	20.4	53.0	67.0	74.1	76.4	74.1	67.0	53.0	20.4	4.0	25.835	258.35
10	25	102.2	27.0	56.1	69.7	76.8	79.0	76.8	69.7	56.1	27.0	6.2	27.392	273.92
10	15	105.4	33.6	59.6	72.6	79.4	81.6	79.4	72.6	59.6	33.6	9.4	29.185	291.85
10	5	108.0	38.6	62.8	75.4	82.1	84.2	82.1	75.4	62.8	38.6	12.0	30.884	308.84
1	Drip.		Drip per Measure.											15.00
41	Whole Depth.		Whole Content.											1147.96

*To find the area of the first Section.*

Here  $38.6 + 38.6 = 77.2$ , the sum of the extreme ordinates;  $(62.8 + 82.1 + 82.1 + 62.8) \times 4 = 289.8 \times 4 = 1159.2$ , four times the sum of all the even ordinates; and  $(75.4 + 84.2 + 75.4) \times 2 = 235.0 \times 2 = 470.0$ , twice the sum of all the odd ordinates; then,  $(77.2 + 1159.2 + 470.0) \times 4 = 1706.4 \times 4 = 6825.6$  square inches, the area of that part of the section circumscribed by the sides of the vessel and the two extreme ordinates.

Again,  $\frac{77.2 \times 12}{3} = \frac{926.4}{3} = 308.8$  square inches, the area of the two segments; and  $6825.6 + 308.8 = 7134.4$  square inches, the area of the whole section; then  $7134.4 \div 231 = 30.884$ , the area in wine gallons.

In the same manner the areas of the other sections must be found by the Learner; and both the areas and contents entered as in the foregoing Dimension Book. (See the Key to this Work, in which the process of finding the areas of the other sections is given.)

*Note.* The contents in the foregoing Table, are found by removing the decimal points in the areas one place towards the right hand.

### A TABLE

*Shewing the Method of Inching the foregoing Wash-Back.*

Wet Inches.	Contents in Gallons.	Wet Inches.	Contents in Gallons.	Wet Inches.	Contents in Gallons.	Wet Inches.	Contents in Gallons.
Drip	15.000 30.884	5	138.536 30.884	9	262.072 30.884	13	382.210 29.185
2	45.884 30.884	6	169.420 30.884	10	292.956 30.884	14	411.395 29.185
3	76.768 30.884	7	200.304 30.884	11	323.840 29.185	15	440.580 29.185
4	107.652 30.884	8	231.188 30.884	12	353.025 29.185	16	469.765 29.185

*Note.* The transverse and conjugate diameters in this, are the same as those given in the first Example; but the areas of the sections and the whole contents differ very materially from each other; hence the necessity of gauging all such vessels by equidistant ordinates. (See the following Remark.)

### A TABLE

*Shewing the Method of Inching the foregoing Wash-Back.*

Wet In- ches.	Contents in Gallons.	Wet In- ches.	Contents in Gallons.	Wet In- ches.	Contents in Gallons.	Wet In- ches.	Contents in Gallons.
Drip	15.000 31.986	4	110.958 31.986	7	206.916 31.986	10	302.874 31.986
2	46.986 31.986	5	142.944 31.986	8	238.902 31.986	11 "	334.860 30.361
3	78.972 31.986	6	174.930 31.986	9	270.888 31.986	12	366.221 30.361

By proceeding in this manner, the content at every wet inch may be obtained; and the Learner is required to continue the above process.

*Note.* In the Key to this Work, the areas of all the sections in the foregoing Dimension Book, are found from the given dimensions; and it is expected that the Learner also determine those areas, before he proceeds to tabulate the vessel.

### REMARKS.

1. By the Rule for the ellipse, the area of the first section is 30.918; the second 29.242; the third 27.450; and the fourth 25.976; hence the content is 1150.86 wine gallons. This content is 2.90 gallons more than the content found in the first Example, and 43.31 gallons less than that found in the second; which proves that the vessel is not *truly* elliptical in either case. (See Remarks in Prob. XX., Part IV.)

2. All Coolers, Jack-Backs, and other vessels used by Distillers, whatever may be their form, must be gauged and fixed according to the directions given in the respective Problems of this Work.

## SECTION VI.

THE METHOD OF GAUGING AND FIXING THE UTENSILS  
OF SOAP MAKERS, STARCH MAKERS, AND GLASS  
MAKERS, AS PRACTISED IN THE EXCISE.

---

SOAP GAUGING.

---

## PRELIMINARY OBSERVATIONS.

SOAP is chiefly made from leys drawn from potash and lime; and boiled up with tallow or oil. It is much used for washing and bleaching linens; and for various other purposes, by Dyers, Perfumers, Hatters, Fullers, &c. &c.

The principal soaps manufactured in this country, are *hard soap*, *soft soap*, and *ball soap*: the soft kind being either white or green.

*Hard soap* is made of leys and tallow; and is most commonly boiled at twice; the first operation being called half-boiling. *White soft soap*, is composed of leys and tallow; and *green soft soap* of leys, tallow, and fish oil. *Ball soap* is made of leys and fine oils; and *yellow soap* of common resin boiled up with tallow.

When *hard soap* has been sufficiently boiled in the copper, it is then put into rectangular frames or boxes, in order to cool and harden. Each of these frames must be at least 45 inches in depth, and none of them must exceed 45 inches in length, or 15 inches in breadth. These frames must all be fairly marked and numbered, for the purpose of preventing mistakes in taking the gauges.

After the process of boiling *soft soap* is completed, it is put into casks, which ought to be barrels, each containing

256 pounds; half-barrels, each containing 128 pounds; firkins, each containing 64 pounds; or half-firkins, each containing 32 pounds avoirdupois, exclusive of the *tare*, or weight of the cask.

The duty on all soaps is charged by the pound avoirdupois; the weight of *hard soap* is ascertained from the gauge; but the weights of soft soap, and ball soap, are always found by scales and weights. Sometimes, however, the *dry inches* of the copper are taken, in order to make compares,

### PROBLEM.

*To find the area and content of a rectangular hard soap-frame, in pounds avoirdupois.*

### RULE.

#### BY THE PEN.

Multiply the mean length by the mean breadth; divide the product by 28.00 for hot, and 27.14 for cold hard soap; and the respective quotients will be the area in pounds. Multiply this area by the depth, and the product will be the content.

*Note.* If the square of the diameter of a circular vessel, be divided by 35.65 for hot, and 34.56 for cold hard soap; the respective quotients will be the area of the vessel in pounds avoirdupois. (See the Table of Divisors on the 83d page.)

#### BY THE SLIDING RULE.

*To find the area.*

### RULE.

As the square divisor on A, is to the length on B; so is the breadth on A, to the area in pounds, on B.

*To find the content.*

### RULE.

As one on A, is to the area on B; so is the depth on A, to the content on B.

## EXAMPLES.

1. The depth of a rectangular hard soap-frame is 54.0, the length 45, and the breadth 15 inches ; required its area and content in pounds, for both hot and cold soap.

## BY THE PEN.

*Inches.*

45 *length.*

15 *breadth.*

225

45

Divisor 28.00 675 (24.10 *area in pounds hot.*

Divisor 27.14 675 (24.87 *area in pounds cold.*

Then  $24.1 \times 54 = 1301.4$ , the content in pounds hot ;  
and  $24.87 \times 54 = 1342.98$ , the content in pounds cold.

## BY THE SLIDING RULE.

*To find the area.*

On A. On B. On A. On B.  
As  $\left\{ \begin{array}{l} 28.00 \\ 27.14 \end{array} \right\} : 45 :: 15 : \left\{ \begin{array}{l} 24.10 \text{ pounds hot.} \\ 24.87 \text{ pounds cold.} \end{array} \right.$

*To find the content.*

On A. On B. On A. On B.  
As  $1 : \left\{ \begin{array}{l} 24.10 \\ 24.87 \end{array} \right\} :: 54 : \left\{ \begin{array}{l} 1301.4 \text{ pounds hot.} \\ 1342.9 \text{ pounds cold.} \end{array} \right.$

2. If the depth of hot soap, in the foregoing frame, be 48 inches ; how many pounds of soap does it contain ?

*Ans.* 1156.8 pounds.

3. The depth of cold soap, in the preceding frame, is 46 inches ; what is the content of the gauge, in pounds ?

*Ans.* 1144.02 pounds.

4. The depth of a soap-frame is 58 inches, its length 48

S s 2

inches, and its breadth 14 inches ; required its area and content in pounds, for both hot and cold soap.

	Areas.	Contents.
<i>Ans.</i> { Hot	21.50	.....1247.00 pounds.
Cold	22.18	.....1286.44 ditto.

## STARCH GAUGING.

### PRELIMINARY OBSERVATIONS.

STARCH is generally made from the meal or flour of wheat, which is put into a vat, with a sufficient quantity of water ; and suffered to ferment for several days. It is then removed from the vat, into hair sieves, where it is washed, to separate the starch from the bran ; and the fine matter which passes through the sieves, is collected in tubs or frames, and is called a *sour water*.

In two or three days, the starch collected at the bottom of the *sour water* is washed again ; and the fine matter thus obtained is denominated a *green water* ; and the coarse part is called a *slime*.

Sometimes the starch which settles to the bottom of a green water, is also washed as before ; and being passed through sieves, and collected in frames, it is denominated a *white water*.

From the *green* or *white water*, the starch is removed to boxes with holes in their bottoms ; where it is permitted to drain and harden ; it is then taken out of the boxes, in order to be dried on bricks. After it is sufficiently dried, it is put into a stove to crust ; the crusted part is then scraped off ; and the pure part put into papers, which are then labelled, and stamped. In this state it is again placed in the stove ; and when it is completely dry, it is taken out and weighed in the presence of the Officer who surveys the Works.

*Note 1.* Starch is not only weighed as noticed above, but it is also gauged in the process of making, both in the vats, frames, and boxes.

When the weight arising from the worst gauge in the bottles, exceeds the weight obtained by the scales, the charge of the duty is made from the gauge; and *vice versa*.

1. The instruments used in Starch Gauging are the same as those of which we have before treated; with the addition of an iron spit, divided into inches and tenths; and a brass plate to screw to the end of the Dimension Cane. Also a spatula to examine the starch in the materials, during the process of making.

### PROBLEM I.

*To gauge and fix a starch vat in the form of a parallelopipedon.*

*Directions for taking the dimensions, &c.*

Find the mean length and breadth as before directed; and also the area in square inches. Divide this area by 2828; and the quotient will be the number of bushels of raw materials.

After the materials have been in a state of fermentation, the area in square inches must be divided by 2386, in order to obtain the area in bushels; and if the area in bushels be multiplied by 25, the product will be the area of the vat in pounds avoirdupois, of *green starch*; hence the whole content in pounds, may be obtained by multiplying the area by the depth.

*Note 1.* It has been ascertained by experience, that on charging the vat with raw materials, each bushel of meal resolves itself into 2828 cubic inches; and that after fermentation, it is reduced to 2386 cubic inches; hence the divisors given in the preceding Rule.

2. It has also been found that on an average, every bushel of meal produces 25 pounds of green starch; consequently any number of bushels multiplied by 25, will give the content in pounds.

3. When starch is made from damaged flour, a bushel of such flour will yield more than 25 pounds of starch; and if it be made from bran, the quantity obtained from a bushel, will be less than 25 pounds. In such cases, the Officer must use his discretion in estimating the quantity of green starch in the vat.

TABLE OF DIVISORS AND GAUGE POINTS FOR STARCH BUSHEL.

State of the Materials.	Divisors for Bushels.		Gauge Points for Bushels.	
	Squares.	Circles.	Squares.	Circles.
Before Fermentation	2828	3601	53.17	60.0
After Fermentation	2386	3038	48.80	55.1

## EXAMPLES.

1. The mean length of a starch vat, in the form of a parallelopipedon, is 186.6 inches, and its mean breadth 136.8 inches ; required its area in bushels, and in pounds, both before and after fermentation.

## BY THE PEN.

10.698 *area.*

25  
53490  
21396

267.450 ditto in pounds.

## BY THE SLIDING RULE.

As the square divisor on A, is to the length on B ; so is the breadth on A, to the area in bushels, on B.

	On A.	On B.	On A.	On B.
As	$\left\{ \begin{array}{l} 2828 \\ 2386 \end{array} \right\}$	: 186.6 ::	136.8 :	$\left\{ \begin{array}{l} 9.0 \text{ before ferm.} \\ 10.7 \text{ after ferm.} \end{array} \right\}$

2. Required the content in bushels and pounds, of the materials and starch in the foregoing vat, before fermentation; when the depth is 28.6 inches.

*Ans.* The content is 258.1436 bushels, and 6453.590 pounds.

3. Required the content in bushels and pounds, of the materials and starch in the preceding vat, after fermentation; when the depth is 26.4 inches.

*Ans.* The content is 282.4272 bushels, and 7060.680 pounds.

4. The length of a starch vat is 225.8 inches, and its breadth 156.6 inches; required its area in bushels and in pounds, both before and after fermentation.

*Ans.* The area before fermentation is 12.503 bushels, and 312.575 pounds; and after fermentation 14.819 bushels, and 370.475 pounds.

## PROBLEM II.

*To gauge and fix a starch vat in the form of the frustum of a cone.*

*To take the dimensions, &c.*

Measure cross diameters in the middle of every 10 inches, from the bottom towards the top of the vessel, as directed in Victuallery; then divide the square of each mean diameter by 3601, and 3038; and the quotients will be the areas of the respective sections, in bushels, before and after fermentation.

*Note.* The areas in pounds must be found by multiplying by 25, as before.

### EXAMPLES.

#### EXAM. 1.

The mean diameter, taken at 5 inches from the bottom of a starch vat, in the form of the frustum of a cone,

measures 98.2 inches ; the diameter at 15 inches from the bottom, 96.4 ; the diameter at 25 inches from the bottom, 94.3 ; and that at 36 inches from the bottom measures 92.5 inches ; it is required to find the area of each section in bushels, and to form a Dimension Book.

BY THE PEN.

*To find the area of the first section.*

*Here  $(98.2 \times 98.2) \div 3601 = 9643.24 \div 3601 = 2.677$  bushels, the area before fermentation ; and  $9643.24 \div 3038 = 3.174$  bushels, the area after fermentation.*

BY THE SLIDING RULE.

As the circular gauge-point on D, is to unity on C ; so is the diameter on D, to the area, in bushels, upon C.

On D. On C. On D. On C.  
*As  $\begin{Bmatrix} 60.0 \\ 55.1 \end{Bmatrix} : 1 :: 98.2 : \begin{Bmatrix} 2.7 \text{ before ferm.} \\ 3.2 \text{ after ferm.} \end{Bmatrix}$*

*Note.* The areas of the three remaining sections are found in the Key to this Work.

DIMENSION BOOK.

A. B.'s Starch Vat, No. 1, gauged Feb. 14, 1822.				
Divisions in Inches.	Depths from the Bottom.	Mean Dia- meters.	Areas in Bushels.	
			Before Fermen.	After Fermen.
12	36	92.5	2.376	2.816
10	25	94.3	2.469	2.927
10	15	96.4	2.580	3.058
10	5	98.2	2.677	3.174

2. If the depth of the materials in the preceding vat, be 38.6 inches ; required the content in bushels and pounds, before fermentation.

*Ans.* The content is 97.69 bushels, and 2442.25 pounds.

3. The diameter taken at 5 inches from the bottom of a conical starch vat, measures 124.3; at 15 inches, 121.4; at 25 inches, 118.3; at 35 inches, 115.5; and at 46 inches from the bottom, the diameter measures 112.6 inches; it is required to determine the area of each section, in bushels, and to form a Dimension Book.

*Answer.*

*Before Fermentation.      After Fermentation.*  
*Areas in Bushels.          Areas in Bushels.*

<i>First section</i> .....	4.290 .....	5.085
<i>Second section</i> .....	4.109 .....	4.851
<i>Third section</i> .....	3.886 .....	4.606
<i>Fourth section</i> .....	3.704 .....	4.391
<i>Fifth section</i> .....	3.520 .....	4.173

### PROBLEM III.

*To gauge and fix a water-frame, in the form of a parallelopipedon.*

*Directions for taking the dimensions, &c.*

Take several lengths, in various parts of the frame, from which find a mean length. Find a mean breadth in the same manner; then multiply the mean length by the mean breadth; divide the product by 34.8, and the quotient will be the area of the frame in pounds avoirdupois of green starch. Multiply this area by the depth; and the product will be the content.

*Note 1.* In the Practice of Gauging, the depth from the top of the frame to the surface of the starch must be taken with a gauging-rod and a float; then if this depth be subtracted from the whole depth of the frame, the remainder will be the depth of the green starch.

2. Any water-frame may be tabulated from the top towards the bottom, either for inches, half inches, or tenths; but as the upper part of a frame is always occupied by water, it will only be requisite to commence the tabulation at the distance of 12 or 15 inches from the top of the frame. This may be most easily performed by subtracting 12 or 15 inches from the whole depth of the frame.

#### EXAMPLES.

##### EXAM. 1.

The length of a water-frame, in the form of a parallelopipedon, is 126.5, its breadth 54.7, and its depth 32

**Note 1.** In order to keep the starch clean, and to prevent it from passing through the holes in the bottom of the box, a cloth is always spread over it previously to putting in the starch. A slider is also sometimes used to divide the box into two parts, in order that the starch may be cut out in smaller pieces. This slider extends from one end of the box to the other; generally dividing the breadth of the box into two equal parts. As these sliders are only used occasionally, it becomes necessary to find two areas of each box; that is, one from dimensions taken in such a manner as to make an allowance for the cloth and slider; and another from dimensions in which an allowance is made for the cloth only. This we conceive may be most correctly done by taking the dimensions of the box without either slider or cloth in it; and then make a proper deduction for them both.

2. When a cloth only is used, twice its thickness must be deducted from both the length and breadth of the box; but when both a slider and cloth are used, then twice the thickness of the cloth must be deducted from the length, and four times its thickness, together with the thickness of the slider, must be deducted from the breadth of the box, in order to obtain the proper dimensions.

3. The mean depth of green starch, in a box, is found by taking several depths, with a spit; and then dividing their sum by their number for a mean depth.

#### EXAMPLES.

1. The length of a starch-box is 65.6 inches, and its breadth 12.5 inches; required its area in pounds of green starch; making an allowance of one-tenth of an inch, in both dimensions, for twice the thickness of the cloth.

*Inches.*

65.5 *reduced length.*

12.4 *reduced breadth.*

2620

1310

655

*Divisor 34.8* 812.20 (23.33 *lbs. area.*

2. If the depth of the starch, in the foregoing box, be 5.4 inches; required the content in pounds.

*Ans.* 125.982 *pounds.*

3. The dimensions of a starch-box, both with and without a slider, are contained in the following Dimension Book; required the content of the starch in pounds, when the depth is 6.3 inches.

## DIMENSION BOOK.

<i>A. B.'s Starch-Box, gauged Feb. 20, 1822.</i>				
Mean Length.	Mean Breadth.		Areas in Pounds.	
	With Slider.	Without Slider.	With Slider.	Without Slider.
64.4	11.6	12.2	21.46	22.57

*Ans. The content with the slider is 135.198; and without the slider, 142.191 pounds.*

*Note 1.* Before the Learner proceeds to find the contents, he must find the areas, both with and without the slider.

2. Any starch-box may be tabulated either for inches or tenths, by the continual addition of the whole area, or one-tenth of the area, as before directed. (See Prob. VII., Sect. II., Part VI.)

---

## GLASS GAUGING.

---

### PRELIMINARY OBSERVATIONS.

THE materials and preparations used for making the various sorts of glass; and also the methods of manufacturing them are different. The time required to found, melt, and refine the materials for each species of glass, after they are prepared, mixed, put into the pots, and placed in the furnace, is likewise somewhat uncertain. These pots are made of clay; and when they are properly tempered in the annealing oven, they are capable of bearing a very great degree of heat.

CROWN GLASS materials consist of kelp, barilla, pot-ash, Lynn-sand, cullet, &c.; and require from twenty-four to thirty hours to found and melt them.

PLATE GLASS is made from barilla, salt-petre, Lynn-sand, cullet, &c.

T t

**FLINT GLASS** materials are salt-petre, red-lead, Lynn-sand, arsenic, &c.

**BROAD GLASS** is made from kelp, soft-sopers, whitsters, ashes, cullet, and various sorts of fresh ashes and sand.

**COMMON BOTTLE GLASS** is made from kelp, hard-sopers, ashes, lime, wood-ashes, cullet, and coarse sea or river sand.

The pots in which it is intended to melt materials for making glass, must first be gauged in the pot-chamber; and when one area is not sufficient for the whole depth, dimensions must be taken in the middle of every 6, 8, or 10 inches, from the top downwards. After the pots have been *annealed*, they must be re-gauged; and their numbers and dimensions, in both cases, must be entered in the Dimension Book.

#### ALLOWANCES.

In calculating the content of each pot, you must make the following allowances for the respective sorts of glass, in consideration of part of the materials being left in the bottom of each pot, which cannot be wrought out; and for other waste in manufacturing; namely, in all pots containing more than one hundred weight, used for making flint, stained, or phial glass, one-fourth part of the materials contained therein, and one inch in the depth of every pot; but in smaller pots, which do not contain one hundred weight, one-fifth only of the materials contained in the same must be allowed. In pots used for making crown, plate, or window glass, one-fourth of the materials must be allowed; and four inches at the bottom; but in pots used for making common bottles, only one-fifth of the materials must be allowed, and three inches at the bottom of each pot.

A TABLE OF DIVISORS AND GAUGE-POINTS FOR DIFFERENT SORTS OF GLASS.

Note. The divisors for squares express the number of cubic inches in a pound of glass.	Divisors for		Gauge Points for Circles.
	Squares.	Circles.	
A pound of flint glass.....	8.469	10.77	3.28
A pound of plate glass .....	9.178	11.68	3.42
A pound of crown and broad glass...	10.516	13.39	3.66
A pound of phial and bottle glass ...	10.178	12.96	3.60
A pound of British cast plate glass...	11.300	14.38	3.70
A pound of German sheet glass.....	11.250	14.38	3.78

\* \* The factors, divisors, and gauge-points for glass, given in the Table on page 83, are not correct. Those given in the preceding Table, are always used in gauging and fixing pots employed in manufacturing glass.

### PROBLEM I.

*To find the area and content of any circular pot, used in making glass.*

#### RULE.

BY THE PEN.

Divide the square of the diameter by the circular divisor; and the quotient will be the area in pounds avoirdupois. Multiply this area by the depth; and the product will be the content.

*Note.* All pots used in melting materials for glass, are circular; consequently, their areas are always determined by the circular divisors and gauge-points, given in the foregoing Table.

#### EXAMPLES.

1. The mean diameter of a cylindrical glass-pot is 32.6, and its depth 33.8 inches; required its area and content in flint and plate glass.

BY THE PEN.

*To find the area.*

*Inches.*

32.6 diameter.

Divisor 10.77)1062.76(98.67 lbs. the area in flint glass.

Divisor 11.68)1062.76(90.98 lbs. the area in plate glass.

T t 2

*To find the content.*

*Then  $98.67 \times 33.8 = 3335.046$ , the content in pounds of flint glass; and  $90.98 \times 33.8 = 3075.124$ , the content in pounds of plate glass.*

BY THE SLIDING RULE.

*To find the area.*

*As the circular divisor on A, is to the diameter on B; so is the diameter on A, to the area on B.*

	On A.	On B.	On A.	On B.
<i>As</i>	$\left\{ \begin{array}{l} 10.77 \\ 11.68 \end{array} \right\}$	$: 32.6 ::$	$32.6 :$	$\left\{ \begin{array}{l} 98.67 \text{ lbs. area.} \\ 90.98 \text{ lbs. area.} \end{array} \right\}$

*To find the content.*

*As the circular gauge-point on D, is to the depth on C; so is the diameter on D, to the content on G.*

	On D.	On C.	On D.	On C.
<i>As</i>	$\left\{ \begin{array}{l} 3.28 \\ 3.42 \end{array} \right\}$	$: 33.8 ::$	$32.6 :$	$\left\{ \begin{array}{l} 3335.0 \text{ lbs. content.} \\ 3075.1 \text{ lbs. content.} \end{array} \right\}$

2. The diameter and depth of a cylindrical pot used in melting materials for making glass, are 36.4, and 38.6 inches respectively; required the area and content in crown and bottle glass.

*Ans. The area is 98.95, and the content 3938.210 pounds of crown glass; and 102.23, and 4068.754 pounds of bottle glass.*

3. Required the area and content of a cylindrical pot, in British plate, and German sheet glass; when the diameter and depth are 38.7 and 39.8 inches respectively.

*Ans. The area is 104.15, and the content 4145.170 pounds of British plate glass; and 104.58, and 4162.284 pounds of German sheet glass.*

## PROBLEM II.

*To gauge and fix a glass-pot in form of a cylinder or the frustum of a cone, as practised in the Exercise.*

*Directions for gauging and fixing a cylindrical pot.*

First find the area of the base, as directed in the last Problem ; from this area, make the proper deductions for waste of materials ; and consider the remainder as the net area of the vessel. Multiply the net area by the whole depth, and the product will be the net content. Reduce the net area and content into hundred weights, quarters, and pounds ; and from the content subtract the area, and the remainder will be the content at one *dry* inch. From this content subtract the same area ; and the remainder will be the content at two *dry* inches, &c. &c. until you have tabulated the whole vessel.

*Note 1.* Before you begin to table, you must not only make an allowance of *one-fourth*, or *one-fifth* of the area, for waste of materials ; but also deduct from the whole content, *once, thrice, or four times* the area, as the case may require, in order to make a proper allowance for the drossy materials left at the bottom of the pot, which cannot be manufactured. (*See Allowances.*)

*2.* The deduction at the bottom may be most easily made, by subtracting the allowance from the whole depth of the pot, before you find the content.

*Directions for gauging and fixing a pot in the form of the frustum of a cone.*

Take diameters in the middle of every 6, 8, or 10 inches, from the top downwards ; find the area of each section ; and make the proper deductions for waste of materials ; then multiply each area by its respective depth, and the sum of the products will be the whole content.

Reduce the areas and content into hundred weights, quarters, and pounds ; and proceed to tabulate the vessel for *dry* inches, as before directed.

*Note.* In order to make the deduction at the bottom, subtract the allowance from the depth corresponding to the bottom section.

## EXAMPLES.

## EXAM. 1.

The mean diameter of a cylindrical pot is 23.3; and its depth 21.0 inches; it is required to tabulate the pot for flint-glass; making an allowance of one-fourth of the whole content, and one inch at the bottom for waste of materials.

*To find the area and content.*

Here  $23.3 \times 23.3 = 542.89$ , the square of the diameter; and  $542.89 \div 10.77 = 50.4$  pounds, the gross area. One-fourth of this area is  $= 12.6$  pounds; then  $50.4 - 12.6 = 37.8$  pounds, the net area of the vessel; and  $37.8 \times 20 = 756$ , the net content.

Now, 37.8 pounds  $= 1$  qr. 9.8 lbs; and 756 pounds  $= 6$  cwt. 3 qrs. 0 lbs.; hence we proceed to tabulate the vessel, as in the following Table.

## A TABLE

*Shewing the Method of Inching the Pot given in this Example.*

Dry In-ches.	Contents in C. Q. P.			Dry In-ches.	Contents in C. Q. P.			Dry In-ches.	Contents in C. Q. P.		
Full	6	3	00.0	3	5	2	26.6	6	4	2	25.2
	0	1	09.8		0	1	09.8		0	1	09.8
1	6	1	18.2	4	5	1	16.8	7	4	1	15.4
	0	1	09.8		0	1	09.8		0	1	09.8
2	6	0	08.4	5	5	0	07.0	8	4	0	05.6
	0	1	09.8		0	1	09.8		0	1	09.8

In this manner the content of the pot may be found at every *dry* inch of its depth; and the Learner is required to continue the process, and form a Table Book.

## A GLASS-MAKER'S TABLE BOOK.

Dry In-ches.	Contents in C. Q. P.			Dry In-ches.	Contents in C. Q. P.			Dry In-ches.	Contents in C. Q. P.		
Full	6	3	00	3	5	2	27	6	4	2	25
1	6	1	18	4	5	1	17	7	4	1	15
2	6	0	08	5	5	0	07	8	4	0	06

In this manner the whole Table Book may be formed; and the Learner is required to continue the process, from the preceding Table, after it has been completed. (See the Key to this Work.)

*Note.* In forming a Glass-Maker's Table Book, the decimals are rejected when they are under five-tenths; but when a decimal is five-tenths or above, it is called one pound.

## EXAM. 2.

The dimensions of a glass-pot in the form of the frustum of a cone, the areas of the several sections, and the contents of the different divisions, are contained in the following Dimension Book; it is required to tabulate the pot for bottle glass; making an allowance of one-fifth of the whole content, and 3 inches at the bottom, for waste of materials.

## DIMENSION BOOK.

Divisions in Inches.	Mean Diams.	Cross Areas.	Net Areas.	Reduced Divisions.	Contents in Pounds.	Areas in C. Q. P.			Contents in C. Q. P.		
						C.	Q.	P.	C.	Q.	P.
6	36.1	100.55	80.44	$\times 6 =$	482.64	0	2	24.44	4	1	6.64
10	32.3	80.50	64.40	$\times 10 =$	644.00	0	2	08.40	5	3	0.09
10	29.5	67.14	53.72	$\times 10 =$	537.20	0	1	25.72	4	3	5.20
10	25.5	50.17	40.14	$\times 7 =$	280.98	0	1	12.14	2	2	0.98
36	dep <sup>d</sup>	Reduced depth		33	1944.82	Content.			17	1	12.82

*Note 1.* The net areas are found by deducting one-fifth of the gross areas from themselves.

2. Before the Learner proceeds to tabulate the vessel, he ought, by way of Practice, to find all the areas and contents given in the Dimension Book.

## A TABLE

*Shewing the Method of Inching the Pot given in this Example.*

Dry In-ches.	Contents in			Dry In-ches.	Contents in			Dry In-ches.	Contents in		
	C.	Q.	P.		C.	Q.	P.		C.	Q.	P.
Full	17	1	12.82	4	14	1	27.06	8	11	3	17.38
	0	2	24.44		0	2	24.44		0	2	08.40
1	16	2	16.38	5	18	3	02.62	9	11	1	08.98
	0	2	24.44		0	2	24.44		0	2	08.40
2	15	3	19.94	6	13	0	06.18	10	10	3	00.58
	0	2	24.44	"	0	2	08.40		0	2	08.40
3	15	0	23.50	7	12	1	25.78	11	10	0	20.18
	0	2	24.44		0	2	08.40		0	2	08.40

In this manner the content of the pot may be obtained at every *dry* inch ; and the Learner is required to complete the process.

## REMARK.

Notwithstanding the areas and contents of glass-pots are estimated in pounds, by the gauge ; yet the duty is always charged upon the real weight of the glass, as found by the scales ; except plate glass, which cannot be conveniently weighed. For the method of charging the duty on flint and phial glass, we must refer the young Officer to the General Letter of Sept. 4th, 1819.

*Note.* In the Practice of Gauging, the *dry* inches of glass-pots are taken with an iron gauging-red, adapted for that purpose.

## CANDLES.

---

### THE METHOD OF ESTIMATING THE WEIGHT OF CANDLES, BOTH BY THE PEN AND THE SLIDING RULE.

---

#### PRELIMINARY OBSERVATIONS.

No person residing out of the limits of the Head Office of Excise in London, who is not assessed to the Church and Poors' Rate, in the parish where he resides, can, according to law, make or manufacture any candles.

It is also enacted that every maker of candles shall give due notice, in writing, of the time when he intends to begin the process of making candles; and specify in such notice, the number of rods of which the making is intended to consist; likewise, the true size and number of candles on each rod; and when it is intended to manufacture mould candles, the exact size and number of the moulds must be specified.

#### PROBLEM.

*Given the number of Candles in one pound, the number on one rod, and the number of rods, to find the whole weight in pounds.*

#### RULE.

##### BY THE PEN.

Multiply the number of candles on one rod, by the number of rods; divide the product by the number of candles in one pound, and the quotient will be the number of pounds required.

## EXAMPLES.

1. It is required to reduce 6.5 gallons of strong beer, at 9s. 2d. per barrel, to table beer, at 1s. 10d. per barrel.

$$\begin{array}{r}
 6.5 \text{ gallons.} \\
 5.5 \text{ factor.} \\
 \hline
 325 \\
 325 \\
 \hline
 35.75 \text{ gallons.} \\
 \hline
 \hline
 \end{array}$$

2. It is required to reduce 7.5 gallons of table beer, at 2s. per barrel, to strong beer, at 10s. per barrel.

$$\begin{array}{r}
 7.5 \text{ gallons.} \\
 .2 \text{ factor.} \\
 \hline
 1.50 \text{ gallons.} \\
 \hline
 \hline
 \end{array}$$

*Note.* These reductions may be easily made by the Sliding Rule, in the following manner : As one on A, is to the factor on B ; so is the given number of gallons on A, to the required number of gallons on B.

## SECTION VII.

*The Method of finding the Areas and Contents of Vessels, in Irish Malt Bushels, and Irish Liquid Gallons; also the Process of reducing Irish to English Measure; and vice versa. Likewise Specific Gravity, or the Method of finding the Magnitude of a Body from its Weight, or the Weight of a Body from its Magnitude; also the Method of estimating the Tonnage of Ships, according to the Parliamentary Rules.*

---

## IRISH MALT AND LIQUID MEASURES.

## PRELIMINARY OBSERVATIONS.

THE Irish malt or corn bushel contains 2178 cubic inches; consequently, it exceeds the English malt bushel by 27.58 cubic inches; and as eight gallons make one bushel, the content of the Irish malt gallon is 272.25 cubic inches. The Irish liquid gallon contains 217.6 cubic inches; consequently, it is 13.4 cubic inches less than the English wine gallon, and 64.4 cubic inches less than the English ale gallon.

All the Rules given in this Work, for finding the areas and contents of vessels, in English measure, may be applied with the same success, in finding the areas and contents of similar vessels in Irish measure; but the Irish multipliers, divisors, and gauge-points, must be used, instead of those given in Part IV.

The factors, divisors, and gauge-points for Irish measures, are found precisely in the same manner as those for English measures; and are given in the following Table.

U u

A TABLE OF IRISH FACTORS, DIVISORS, AND GAUGE-POINTS, FOR SQUARES AND CIRCLES.

	Factors for		Divisors for		Gauge-Points for	
	Squares.	Circles.	Squares.	Circles.	Squares.	Circles.
Irish malt bushel	.000459	.000361	2178.00	2773.10	46.67	52.66
Irish malt gallon	.003673	.002884	272.25	346.64	16.50	18.62
Irish liquid gallon	.004595	.003609	217.60	277.05	14.75	16.64

### PROBLEM I.

*To find the area and content of any angular vessel, in Irish malt bushels, and liquid gallons.*

### RULE.

By the Rules given in Part IV., find the area of the base in square inches; then multiply this area by .000459 and .004595; or divide it by 2178 and 217.6, and the respective products or quotients will be the area of the base, in Irish malt bushels, and liquid gallons. Multiply this area by the depth; and the product will be the content.

*Note.* The preceding Rule will give the content of all angular vessels, whose sides are perpendicular to the base.

### EXAMPLES.

1. The length of a vessel in the form of a parallelepipedon, is 84 inches, its breadth 56 inches, and its depth 42 inches; required its area and content in Irish malt bushels, and liquid gallons.

*By Prob. II., Part IV., we have  $84 \times 56 = 4704$ , the area of the base, in square inches; and  $4704 \div 2178 = 2.159$ , the area in Irish malt bushels; also  $4704 \div 217.6 = 21.617$ , the area in Irish liquid gallons; then  $2.159 \times 42 = 90.678$ , the content of the vessel in Irish malt bushels; and  $21.617 \times 42 = 907.914$ , the content in Irish liquid gallons.*

The length of a rectangular vessel is 96.8, its breadth and its depth 55.4 inches; required its area and t in Irish malt bushels, and liquid gallons.

*The area and content are 2.826 and 156.5604 Irish ushels; and 28.292 and 1567.3768 Irish liquid*

#### REMARK.

his Problem we have made choice of the Parallelon, because no other angular figure occurs so frequently in Gauging; however, if the content of any be found in cubic inches, by the Rules given in .; and this content divided by 217.6, and 2178; pective quotients will be the content in Irish liquid , and malt bushels.

#### PROBLEM II.

*Find the area and content of a cylindrical vessel, in Irish malt bushels, and liquid gallons.*

#### RULE.

ltiply the square of the diameter by .000961, and 9; or divide it by 2773.1, and 277.05; and the tive products or quotients will be the area of the in Irish malt bushels, and liquid gallons. Multiply ea by the depth, and the product will be the con-

#### EXAMPLES.

The diameter of a cylindrical vessel is 56 inches, and th 48 inches; required its area and content, in Irish ushels and liquid gallons.

*56 × 56 = 3136, the square of the diameter; and ÷ 2773.1 = 1.1308, the area in Irish malt bushels; 3136 ÷ 277.05 = 11.3192, the area in Irish liquid ; then 1.1308 × 48 = 54.2784, the content of the in Irish malt bushels; and 11.3192 × 48 = 543.3216, tent in Irish liquid gallons.*

The diameter of a cylindrical vessel is 82.4 inches, s depth 52.6 inches; required its area and content in malt bushels and liquid gallons.

*Ans.* The area and content are 2.448 and 128.7648 Irish malt bushels; and 24.507 and 1289.0682 Irish liquid gallons.

## REMARKS.

1. Wherever the circular divisors 359.05, 994.12, or 2738.00, are used in this Work, to find the areas or contents of vessels, in English ale and wine gallons, and malt bushels; if, instead of these, we substitute 277.05, &c. 2773.10, the results will give the areas or contents of the same or similar vessels, in Irish liquid gallons, and malt bushels.

2. The Irish circular divisors, for the frustum of a cone in order to find its content in Irish liquid gallons, and malt bushels, are 831.15, and 8319.3; for a sphere, or a spheroid, 415.575, and 4159.65; for the middle frustum of a spheroid, 831.15, and 8319.3; for a parabolic spindle, 519.46, and 5199.56; for the middle frustum of a parabolic spindle, 4155.75, and 41596.5; and for the frustum of a parabolic conoid, 554.1, and 5546.2.

3. In order to find the content of a circular vessel, in Irish liquid gallons, and malt bushels, by Prob. XIX., Part V., the divisors 1662.3, and 16638.6 must be used; if the content be required by Prob. XX.; then 3324.6, and 33277.2 must be used as divisors; and lastly, if the content be required by Rule I., Prob. XXI., we must then use the square divisors 217.6, and 2178; and the results will be the contents of the vessels in Irish liquid gallons, and malt bushels.

## PROBLEM III.

*To reduce Irish measure to English measure.*

## RULE.

Multiply the given number of bushels, Irish measure, by 1.0148; and the product will be the number of bushels, English measure. Also, multiply the given number of gallons, Irish measure, by .7716, and .9410; and the respective products will be the number of ale and wine gallons, English measure.

*Now.* The multipliers given in the preceding Rule, are found by dividing the Irish by the English square divisors.

EXAMPLES.

In 186 Irish, how many English bushels?

*Ans.*  $1.0128 \times 186 = 188.3808$  *English bushels.*

In 106 Irish gallons, how many English ale and wine

*Ans.*  $.7716 \times 106 = 81.7896$  *English ale gallons; and*  
 $\times 106 = 99.8414$  *English wine gallons.*

A Maltster in Dublin, ships for Liverpool, 2685 bushels of malt, according to the gauge in Ireland; for how many bushels must the duty be charged, when the malt arrives in England?

*Ans.* 2719.368 *English malt bushels.*

A Distiller in Waterford, ships for Bristol, 25 casks of whiskey, containing 2864 gallons, according to the gauge in Ireland; for how many gallons must the duty be charged, when the liquor arrives in England?

*Ans.* 2697.6016 *English wine gallons.*

A Brewer in Cork, ships for Milford, 56 barrels of ale each containing 32 gallons, according to the gauge in Ireland; for how many barrels of 36 gallons each, must the duty be charged, when the liquor arrives in England?

*Ans.* 38 barrels, 14.7 gallons, *English ale measure.*

PROBLEM IV.

*To reduce English measure to Irish measure.*

RULE.

Multiply the given number of bushels, English measure, by 1.0128; and the product will be the number of bushels, Irish measure. Also, multiply the given number of gallons, ale measure, by 1.2959; and the given number of gallons, wine measure, by 1.0615; and the respective products will be the number of gallons, Irish measure.

*Proof.* The multipliers given in the preceding Rule, are found by dividing the English by the Irish square divisors.

EXAMPLES.

In 198 English, how many Irish bushels?

*Ans.*  $.9873 \times 198 = 195.4854$  *Irish malt bushels.*

2. In 2685 English ale gallons, how many gallons, Irish measure ?  
*Ans. 3479.4915 gallons.*

3. In 3634 English wine gallons, how many gallons, Irish measure ?  
*Ans. 3857.491 gallons.*

#### REMARK.

All the directions and Rules, given in Part VI., for gauging, fixing, and inching the Utensils of Victuallers, Common Brewers, Maltsters, and Distillers, may be applied with the same success in gauging, fixing, and inching similar vessels, according to the Irish measures ; care however, must always be taken to use the Irish divisors, in order that the areas and contents of the vessels may be obtained in Irish liquid gallons, and malt bushels.

---

## SPECIFIC GRAVITY.

---

#### PRELIMINARY OBSERVATIONS.

SPECIFIC GRAVITY is the relative weight or gravity of any body or substance, considered with regard to some other body which is assumed as a standard of comparison ; and this standard, by universal consent and practice, is rain-water, in consequence of its being less subject to variation than any other body. By a very fortunate coincidence, it happens that a cubic foot of rain-water weighs exactly 1000 ounces avoirdupois ; consequently, assuming this as the specific gravity of rain-water, and comparing all other bodies with it, the same numbers that express the specific gravities of bodies, will also express the weight of a cubic foot of each body, in avoirdupois ounces, which is a great convenience in numerical computations.

*A TABLE of the Specific Gravities of Bodies.*

Malaga and Sherry are brought from Malaga and Xeres, two towns situated in Granada and Andalusia, in Spain. Champagne, Claret, and Burgundy, are brought from France; and Port is brought from Oporto and Lisbon, in Portugal.

### PROBLEM I.

*To find the magnitude of a body from its weight.*

#### RULE.

As the tabular specific gravity of the body,  
Is to its weight in avoirdupois ounces;  
So is one cubic foot, or 1728 cubic inches,  
To its magnitude in feet, or inches, respectively.

#### EXAMPLES.

1. A quantity of Madeira wine weighs  $94\frac{1}{2}$  pounds avoirdupois; required its content in wine gallons.

oz.	lb. oz.	cu. in.
As 1038	: 94 8	:: 1728
	16	1512
	<hr/> 572	<hr/> 3456
	94	1728
	<hr/> 1512	8640
		<hr/> 1728

Divisor 1038)2612736(2517 cubic inches.

And  $2517 \div 231 = 10.89$ , the content in wine gallons.

2. A cask of proof spirits weighs 186 pounds 12 ounces avoirdupois; what is its content in wine gallons; deducting 45 pounds 9 ounces for the weight of the cask?

*Ans.* 18.32 wine gallons.

3. A piece of carved mahogany weighs 58lb. 10 oz. avoirdupois; what is its content in cubic inches?

*Ans.* 1524 cubic inches.

4. An empty cask weighs 56 pounds 9 ounces; required the content of the materials, in cubic inches; the cask being made of dry oak.

*Ans.* 1690 cubic inches.

## PROBLEM II.

*find the weight of a body from its magnitude.*

## RULE.

As one cubic foot, or 1728 cubic inches,  
to the content of the body ;  
So is its tabular specific gravity,  
So the weight of the body.

## EXAMPLES.

What is the weight of 146 gallons of Port wine?

Required the weight of a block of marble, whose  
h is 68 feet, and its breadth and thickness each 12  
these being the dimensions of one of the stones in  
alls of Balbec.

*s. 688.4375 tons, which is nearly equal to the burthen*  
*East India ship.*

*e. Balbec is a town of Syria, situated about 37 miles north of*  
*scus. Its ruins are stupendously grand. It is supposed to have*  
*ounded before the Christian æra.*

*The Method of Estimating*  
**THE TONNAGE OF SHIPS.**

---

PRELIMINARY OBSERVATIONS.

If the number of cubic feet of water which a ship displaces, in sinking from the *light water-mark* to the *load water-mark*, be divided by 35, (the number of cubic feet of sea-water in one ton,) the quotient will be the number of tons which the vessel is capable of carrying, or the vessel's true burthen.

Now the number of cubic feet of water so displaced, is exactly equal to the solid content of so much of the body of the ship, as is contained between the said two *water-lines* or *marks*; but in consequence of the great variety of forms given to this part of the vessel, no exact practical Rule can be given that will apply in all cases.

If indeed the areas of three or five horizontal sections of that part of the hull contained between the said two water-lines, could be obtained by means of equidistant ordinates, then the content might be correctly found by Prob. XIX., or XX., Part V.; but as the taking of the dimensions of these sections would be attended with great difficulty, we shall give the following Parliamentary Rules for ascertaining the tonnage of Merchants' and King's ships.

CASE I.

*When the vessel is laid dry.*

RULE.

Measure the length on a straight line along the rabbet of the keel of the ship, from the back of the main stern-post, to a perpendicular line let fall from the fore-part of the main stem, under the bowsprit; from this length, subtract  $\frac{3}{4}$  of the extreme breadth; and the remainder will be the length of the keel, for tonnage. The breadth must be taken from outside to outside of the plank, in the broadest part of the ship, whether above or below the main wales,

sive of all manner of doubling planks, or sheathing, may be wrought upon the sides of the vessel; then, multiply the length of the keel, in feet, by the breadth, this product by half the breadth; divide the last act by 94; and the quotient will be the tonnage required.

## EXAMPLES.

The length from the back of the stern-post to a line parallel from the fore-part of the main stem, is 88 feet 6 inches; the extreme breadth from outside to outside of the beam, 26 feet 6 inches; required the tonnage of the ship.

*Feet.*

*Gross length 88.5 of the keel.*

$26.5 \times \frac{2}{3} = 15.9$  *the deduction.*

*True length 72.6 difference.*

$26.5$  *breadth of the beam.*

3630

4356

1452

1923.90 *first product.*

13.25 *half the breadth.*

961950

384780

577170

192890

25491.6750 *second product.*

Then  $25491.675 \div 94 = 271.188$  tons, the burthen or tonnage required.

The length from the back of the stern-post to a line parallel from the fore-part of the main stem, is 108 feet 9 inches; the extreme breadth from outside to outside of the beam, 29 feet 6 inches; required the tonnage of the ship.

*Ans. 421.469 tons.*

## CASE II.

*When the vessel is afloat.*

## RULE.

Drop a plumb-line over the stern of the ship, and measure the distance between this line and the aft part of

the stern-post, at the load water-mark ; then measure from the top of the said plumb-line, in a parallel direction with the water, to a perpendicular point immediately over the load water-mark, at the fore-part of the main stem ; from the last measured distance subtract the former ; and the remainder will be the ship's extreme length. From this length, deduct 3 inches for every foot of the load-draught of water, for the rake abaft ; and also  $\frac{3}{4}$  of the ship's extreme breadth for the rake of the stem ; and the remainder will be the true length of the keel, for tonnage. The extreme breadth must be measured, and the tonnage found as directed in the first Case.

#### EXAMPLE.

The true length of an eighty gun ship, after all deductions are made, in taking the dimensions, is 150 feet 9 inches ; and the extreme breadth 50 feet 6 inches ; required the tonnage of the vessel.

*Ans.* 2044.9478 tons.

*Note* 1. It is found by experience, that ships of war carry less ; and most merchant-ships carry considerably more tonnage than they are rated at, by the preceding Rules.

2. Some Writers on this subject, divide by 100, instead of 94, for King's ships. On the same principles, the divisor for Merchants' ships should be decreased, perhaps to 90 or 92.

*The Use of the foregoing Table.*

The process of reducing ale gallons into barrels and firkins, by the preceding Table, is extremely easy; for Example, suppose it be required to reduce 828 gallons into barrels and firkins; then opposite to 24 barrels in the first column, we find 824.5 gallons in the third column; this being the nearest to the given number. Hence the given number of gallons is equal to 24 barrels and 1 firkin; and by subtraction we have  $828 - 824.5 = 3.5$  odd gallons to be transferred to the next charge.

Again, suppose it were required to reduce 2336.5 gallons to barrels and firkins; we find 2329 opposite to  $68\frac{1}{4}$  barrels; hence 68 barrels and 2 firkins must be charged with the duty; and  $2336.5 - 2329 = 7.5$  odd gallons, which must be carried to the next charge.

*Note.* The fractions at the top of the columns of the preceding Table, denote one-quarter, one-half, and three-fourths of a barrel.

FINIS.

## ERRATA.

Page.	Line.
5,	14, for $4.27 \times 1 = 042.7$ , read $4.27 \times 10 = 42.7$ .

and by WILSON and SONS, York.

I.

*In one handsome Volume Octavo, price 12s. in boards,*  
A new Edition, greatly enlarged by numerous additions and improvements, and illustrated by two hundred and fifty Practical Examples, one hundred and sixty Wood Cuts, twelve Copper-plates, and an Engraven Field-Book of sixteen pages, of

**A COMPLETE TREATISE ON  
PRACTICAL  
LAND-SURVEYING,  
IN SEVEN PARTS,**

**DESIGNED CHIEFLY FOR THE USE OF SCHOOLS AND  
PRIVATE STUDENTS.**

Containing I. Definitions, Problems, and Theorems in Geometry, requisite in Land-Surveying.

II. A Description of the Chain, Cross-Staff, Offset-Staff, Compass, and Field-Book; also Directions and Cautions to Young Surveyors, when in the Field, &c.

III. To survey with the Chain and Cross; also, to measure Meres, Woods, and Lines upon which there are Impediments.

IV. The Method of Surveying with the Chain only; and of measuring Meres, Woods, Roads, Rivers, Canals, Distances, Lines upon which there are Impediments, and Hilly Ground.

V. The Method of Surveying and Planning Estates, illustrated by several rough and finished Plans, and an engraved Field-Book of sixteen Pages.

VI. Rules and Directions for laying out any given Quantity of Land, in any proposed Figure; for parting from any Field or Figure, any Quantity of Land required; and for dividing a Piece of Land among sundry Claimants, in the Proportion of their respective Claims, or a Common, &c. of variable Value, among any number of Proprietors, in the Proportion of their respective Interests. This is exemplified by a Plan of Three Small Estates, and a Common, which is divided according to its Quality. Also the Method of reducing Statute Measure to Customary, and *vice versa*.

VII. The Method of Measuring and Planning Villages, Towns, and Cities; Directions for Measuring and Planning Building Ground, and dividing it into convenient Lots for Sale; and miscellaneous Questions relating to Surveying, Laying-out, Parting-off, and Dividing Land.

**By A. NESBIT,**

*Master of the Commercial and Mathematical Academy, Oxford Road,  
Manchester.*

The Whole explained and simplified in such a Manner, as will, the Author hopes, render ample Assistance, both in Theory and Practice, to Teachers occupied in disseminating the Knowledge of this useful Branch of Geometry; or to those Persons who desire to become their own Instructors,

## II.

*In one large Volume 12mo, price 6s. Bound,*

A new Edition, illustrated by five hundred and eighty Practical Examples, two hundred Wood Cuts, three Copper-plates, and an Engraven Field-Book, of

### A TREATISE ON PRACTICAL MENSURATION, IN EIGHT PARTS;

Containing the most approved Methods of drawing Geometrical Figures; Mensuration of Superficies; Land-Surveying; Mensuration of Solids; the Use of the Carpenter's Rule; Timber-Measure, in which is shown the Method of measuring and valuing standing Timber; Artificers' Works, illustrated by the Dimensions and Contents of a House; Mensuration of Hay-stacks, Drains, Canals, Marl-pits, Ponds, Mill-dams, Embankments, Quarries, and Coal-heaps; Conic Sections and their Solids; Gauging in all its Departments; and a Dictionary of the Terms used in Architecture.

By A. NESBIT.

## Introduction

## P R E F A C E.

---

THAT KEYS to Works on Arithmetic, Mensuration, and other books intended for the purposes of education, are of great utility, both to teachers and private students, is now universally admitted. They tend to diminish the labour that is the inseparable attendant on the important, but arduous occupation of instructing youth; as by referring to them, the tutor is able to discover the accuracy or inaccuracy of his pupils' solutions, without the trouble of investigating every operation.

Many young men of genius, are, by particular circumstances, prevented from obtaining a knowledge of sciences in their youth. To these, Works of this nature are of inestimable value; as they enable them to pursue their private studies with ultimate success, and, in many cases, it would be impossible to obtain the assistance of a living instructor.

The first Five Parts of the following Work contain solutions to all the Questions that are not answered in the corresponding parts of the Practical Gauging. Some of these solutions are put down at length; but the greater part of them are abridged by means of the symbolical characters. This method of entering solutions is both elegant and perspicuous; and is now generally adopted by our best mathematicians.

Part the Sixth contains numerous Note-Books, Dimension-Books, Table-Books, &c. &c. relating to the method of Gauging, Fixing, and Inching the Utensils of Victuallers, Common Brewers, Maltsters, Distillers, Rectifiers, Wine-Merchants, Spirit-Merchants, Cider-makers, Soap-Makers, Starch-Makers, and Glass-Makers. It also contains Rules for reducing Spirits of any given strength, to any required strength.

Part the Seventh contains Tables of the Duties, Allowances, and Drawbacks on all Excisable Commodities in the United Kingdom of Great Britain and Ireland.

Part the Eighth comprehends Precedents of Vouchers and Abstracts, for assisting young Officers of the Excise, in making up their Accounts. These, it is hoped, will be found more concise and perspicuous than any others that have hitherto appeared in Works on Gauging.

The First Five Parts will be found extremely useful to teachers and private students; the two following Parts are adapted for the general use of Officers of the Excise and Customs; and for all Manufacturers of Excisable Commodities; and the Eighth Part is intended to furnish young Officers with such Precedents of Vouchers and Abstracts, as will enable them to make up their Accounts in a clear and perspicuous manner.

It now only remains for us to beg the indulgence of the Public, for any imperfections that may have escaped our observation; for it cannot be expected that a Work containing Solutions to more than *six hundred new Questions*, besides numerous and extensive Tables,

will be found entirely free from errors. Every possible attention, however, has been paid in solving the questions, and correcting the press; so that we hope that the errors will be found comparatively few and of little moment; and will be readily excused by all those who are acquainted with the difficulty of making numerous and intricate scientific calculations.

A. NESBIT.

 \hline
 364160 \\
 345744 \\
 \hline
 184160 \\
 153664 \\
 \hline
 30496 \text{ rem.} \\
 \hline
 \hline
 \end{array}$$

$$\begin{array}{r}
 .70012494 \text{ (Ans.)} \\
 64 \\
 163 \overline{)601} \\
 \underline{489} \\
 1666 \overline{)11224} \\
 \underline{9996} \\
 16727 \overline{)122894} \\
 \underline{117089} \\
 \underline{\underline{5805 \text{ rem.}}}
 \end{array}$$

EXAM. 9.

Here  $\frac{18 \times 23 \times 35 \times 42}{20 \times 26 \times 43 \times 54} = \frac{608580}{1207440} = .50402504;$   
 and  $\sqrt{.50402504} = .7099$ , the answer required.

## SQUARE ROOT,

APPLIED TO THE

*Solution of Mathematical Problems.*

### PROBLEM I,

*To find a mean proportional between two given numbers.*

EXAM. 2.

$$\begin{array}{r}
 243 \\
 48 \\
 \hline
 1944 \\
 972 \\
 \hline
 11664 \text{ (Ans.)} \\
 1 \\
 208 \overline{)1664} \\
 \underline{1664} \\
 \underline{\underline{0}}
 \end{array}$$

## EXAM. 3.

$$\begin{array}{r}
 36 \\
 16 \\
 \hline
 216 \\
 36 \\
 \hline
 576(24 \text{ lb. the weight required.} \\
 4 \\
 \hline
 44)176 \\
 176 \\
 \hline
 \hline
 \end{array}$$

Hence it is evident that the arms of the balance are to each other, as 16 to 24, or as 24 to 36, or as 2 to 3.

## PROBLEM II.

*To find the side of a square equal in area to any given superficies.*

## EXAM. 1.

$$\begin{array}{r}
 2025(45 \text{ feet, Ans.} \\
 16 \\
 \hline
 85)425 \\

324(18 inches, Ans.

$$\begin{array}{r}
 1 \\
 \hline
 28 \overline{)224} \\
 224 \\
 \hline\hline
 \end{array}$$

## PROBLEM IV.

To find the hypotenuse of a right angled triangle,  
when the base and perpendicular are given.

## EXAM. 1.

Here  $105 \times 105 = 11025$ , the square of the base ; and  
 $56 \times 56 = 3136$ , the square of the perpendicular ; then  
 $\sqrt{11025 + 3136} = \sqrt{14161} = 119$  inches, the hy-  
 pthenuse.

## EXAM. 2.

Here  $112 \times 112 = 12544$ , the square of the length ;  
 and  $84 \times 84 = 7056$ , the square of the breadth ; then  
 $\sqrt{12544 + 7056} = \sqrt{19600} = 140$  inches, the dia-  
 gonal required.

## EXAM. 3.

Here  $72.5 \times 72.5 \times 2 = 5256.25 \times 2 = 10512.5$ ,  
 twice the square of the side ; and  $\sqrt{10512.5} = 102.53$   
 inches, the diagonal required.

D

## PROBLEM V.

*Given the hypotenuse of a right angled triangle, and either of the legs, to find the other leg.*

## EXAM. 1.

Here  $153^2 - 135^2 = 23409 - 18225 = 5184$ ; and  $\sqrt{5184} = 72$  inches, the perpendicular required.

## EXAM. 2.

Here  $60^2 - 36^2 = 3600 - 1296 = 2304$ ; and  $\sqrt{2304} = 48$  inches, the perpendicular depth required.

## EXAM. 3.

Here  $125^2 - 100^2 = 15625 - 10000 = 5625$ , and  $\sqrt{5625} = 75$ , the depth.

Also,  $100^2 - 78^2 = 10000 - 6084 = 3916$ ; and  $\sqrt{3916} = 62.577$  the breadth.

## PROBLEM VI.

*Given the head and bung diameters and length of a cask, to find the diagonal or distance between the centre of the bung hole, and that point where the middle of the opposite staff and head of the cask intersect each other.*

## EXAM. 1.

Here  $\frac{24 + 18}{2} = \frac{42}{2} = 21$ , half the sum of the diameters; and  $\frac{30}{2} = 15$ , half the length of the cask; then  $21^2 + 15^2 = 441 + 225 = 666$ ; and  $\sqrt{666} = 25.8$  inches, the diagonal required.

## EXAM. 2.

Here  $\frac{32 + 24}{2} = \frac{56}{2} = 28$ , half the sum of the diameters ; and  $\frac{40}{2} = 20$ , half the length of the cask ; then  $28^2 + 20^2 = 784 + 400 = 1184$  ; and  $\sqrt{1184} = 34.4$  inches, the diagonal required.

## PROBLEM VII.

*Given the diagonal and diameters of a cask, to find its length.*

## EXAM. 1.

Here  $\frac{24 + 18}{2} = \frac{42}{2} = 21$ , half the sum of the diameters ; then  $25.8^2 - 21^2 = 665.64 - 441 = 224.64$  ; and  $\sqrt{224.64} \times 2 = 14.98 \times 2 = 29.96$  inches, the length of the cask.

## EXAM. 2.

Here  $\frac{35 + 29}{2} = \frac{64}{2} = 32$ , half the sum of the diameters ; then  $40^2 - 32^2 = 1600 - 1024 = 576$  ; and  $\sqrt{576} \times 2 = 24 \times 2 = 48$  inches, the length of the cask.

## CUBE ROOT.

*To extract the Cube Root of any number.*

EXAM. 2.

$$\begin{array}{r}
 \dot{6}3044\dot{7}92(398 \text{ Ans.} \\
 \underline{27} \\
 36044 \text{ resolvend.} \\
 \quad 9 \text{ triple of 3.} \\
 \quad 27 \text{ triple square of 3.} \\
 \quad \underline{279} \text{ divisor.} \\
 \quad 729 \text{ cube of 9.} \\
 \quad 729 \text{ square of 9 } \times \text{ by the triple of 3.} \\
 \quad 243 \text{ triple of 9 } \times \text{ by the square of 3.} \\
 \quad \underline{32319} \text{ subtrahend.} \\
 \quad 3725792 \text{ second resolvend.} \\
 \quad \quad 117 \text{ triple of 39.} \\
 \quad \quad 4563 \text{ triple square of 39.} \\
 \quad \quad \underline{45747} \text{ second divisor.} \\
 \quad \quad 512 \text{ cube of 8.} \\
 \quad \quad 7488 \text{ square of 8 } \times \text{ by the triple of 39.} \\
 \quad \quad 36504 \text{ triple of 8 } \times \text{ by the square of 39.} \\
 \quad \quad \underline{3725792} \text{ second subtrahend.} \\
 \underline{\underline{\hspace{1.5cm}}}
 \end{array}$$

PROOF.

Here  $398 \times 398 \times 398 = 158404 \times 398 = 63044792$ , the same as the given number.

## EXAM. 3.

$$\begin{array}{r}
 958585256(986 \text{ Ans.} \\
 \underline{729} \\
 229585 \text{ resolvend.} \\
 \underline{27} \text{ triple of 9.} \\
 243 \text{ triple square of 9.} \\
 \underline{2457} \text{ divisor.} \\
 512 \text{ cube of 8.} \\
 1728 \text{ square of 8 } \times \text{ by triple of 9.} \\
 1944 \text{ triple of 8 } \times \text{ by square of 9.} \\
 \underline{212192} \text{ subtrahend.} \\
 17393256 \text{ second resolvend.} \\
 \underline{294} \text{ triple of 98.} \\
 28812 \text{ triple square of 98.} \\
 \underline{288414} \text{ second divisor.} \\
 216 \text{ cube of 6.} \\
 10584 \text{ square of 6 } \times \text{ by the triple 98.} \\
 172872 \text{ triple of 6 } \times \text{ by the square of 98.} \\
 \underline{17393256} \text{ second subtrahend.} \\
 \underline{\underline{\hspace{1.5cm}}}
 \end{array}$$

## PROOF.

Here  $986 \times 986 \times 986 = 972196 \times 986 = 58585256$ , the same as the given number.

D 3.

## EXAM. 4.

$\dot{6}3\dot{3}.\dot{8}39779(8.59 \text{ Ans.}$

512

121839 resolvend.

24 triple of 8.

192 triple square of 8.

1944 divisor.

125 cube of 5.

600 square of 5  $\times$  by triple of 8.

960 triple of 5  $\times$  by square of 8.

102125 subtrahend.

19714779 second resolvend.

255 triple of 85.

21675 triple square of 85.

217005 second divisor.

729 cube of 9.

20655 square of 9  $\times$  by triple of 85.

195075 triple of 9  $\times$  by square of 85.

19714779 second subtrahend.

## PROOF.

Here  $8.59 \times 8.59 \times 8.59 = 73.7881 \times 8.59 = 633.839779$ , the same as the given number.

## EXAM. 5.

$\sqrt[3]{1006.012008}$  (10.02 *Ans.*

1

006 resolvend.

3 triple of 1.

3 triple square of 1.

33 divisor.

6012 second resolvend.

30 triple of 10.

300 triple square of 10.

3030 second divisor.

6012008 third resolvend.

300 triple of 100.

30000 triple square of 100.

300300 third divisor.

8 cube of 2.

1200 square of 2  $\times$  by triple of 100.

60000 triple of 2  $\times$  by square of 100.

6012008 subtrahend.

## PROOF.

Here  $10.02 \times 10.02 \times 10.02 = 100.4004 \times 10.02$   
 $= 1006.012008$ , the same as the given number.

## EXAM. 6.

$$\begin{array}{r}
 \begin{array}{r}
 \dot{.}89863\dot{2}1\dot{2}5 \\
 729 \\

 2457 \text{ divisor.} \\
 216 \text{ cube of } 6. \\
 972 \text{ square of } 6 \times \text{ by triple of } 9. \\
 1458 \text{ triple of } 6 \times \text{ by square of } 9. \\
 \hline
 155786 \text{ subtrahend.} \\
 \hline
 13896125 \text{ second resolvend.} \\
 288 \text{ triple of } 96. \\
 27648 \text{ triple square of } 96. \\
 \hline
 276768 \text{ second divisor.} \\
 125 \text{ cube of } 5. \\
 7200 \text{ square of } 5 \times \text{ by triple } 96. \\
 138240 \text{ triple of } 5 \times \text{ by square of } 96. \\
 \hline
 13896125 \text{ second subtrahend.} \\
 \hline
 \hline
 \end{array}
 \end{array}$$

## PROOF.

Here  $.965 \times .965 \times .965 = .931225 \times .965 = .898632125$ , the same as the given number.

## EXAM. 7.

Here  $\sqrt[3]{\frac{1}{2}} = .904761904$ .

$\sqrt[3]{.904761904} = .967$  Ans.

729

175761 resolvend.

27 triple of 9.

243 triple square of 9.

2457 divisor.

216 cube of 6.

972 square of 6  $\times$  by triple of 9.

1458 triple of 6  $\times$  by square of 9.

155736 subtrahend.

20025904 second resolvend.

288 triple of 96.

27648 triple square of 96.

276768 second divisor.

343 cube of 7.

14112 square of 7  $\times$  by triple of 96.

193536 triple of 7  $\times$  by square of 96.

19495063 second subtrahend.

530841 remainder.

## PROOF.

ere  $.967 \times .967 \times .967 = .935089 \times .967 = 231068$ , the cube of the root; to which add the inder, and we obtain  $.904761904$ , the proof read.

## CUBE ROOT,

APPLIED TO THE

*Solution of several useful Mathematical Problems.*

## PROBLEM I.

*To find the side of a cubical vessel that shall be equal in content to any given vessel, whose form is that of a parallelopipedon, a cylinder, a prism, a cone, &c. &c.*

## EXAM. 1.

Here  $\sqrt[3]{216000} = 60$  inches, the answer required.

## EXAM. 2.

Here  $231 \times 43 = 9933$ , the number of cubic inches in 43 wine gallons; and  $\sqrt[3]{9933} = 21.496$  inches, the side required.

## EXAM. 3.

Here  $2150.42 \times 48 = 103220.16$ , the number of cubic inches contained in 48 malt bushels; and  $\sqrt[3]{103220.16} = 46.908$  inches, the answer required.

## PROBLEM II.

*Given the dimensions of any vessel, to find the dimensions of another similar vessel, that shall be any number of times greater or less than the given vessel.*

## EXAM. 1.

Here  $216^3 = 10077696$ , the cube of the given length; and  $10077696 \times 8$  (the ratio)  $= 80621568$ ; hence  $\sqrt[3]{80621568} = 432$  inches, the length of the required vessel.

Also,  $125^3 = 1953125$ , the cube of the given breadth; and  $1953125 \times 8 = 15625000$ ; hence  $\sqrt[3]{15625000} = 250$  inches, the breadth of the required vessel.

Lastly,  $64^3 = 262144$ , the cube of the given depth; and  $262144 \times 8 = 2097152$ ; hence  $\sqrt[3]{2097152} = 128$  inches, the depth of the required vessel.

## EXAM. 2.

Here  $64^3 = 262144$ , the cube of the given depth; and  $262144 \times 27$  (the ratio)  $= 7077888$ ; hence  $\sqrt[3]{7077888} = 192$  inches, the depth of the required vessel.

Also,  $27^3 = 19683$ , the cube of the given diameter; and  $19683 \times 27 = 531441$ ; hence  $\sqrt[3]{531441} = 81$  inches, the diameter of the required vessel.

## EXAM. 3.

Here  $343^3 = 40353607$ , the cube of the given depth; and  $40353607 \div \frac{1}{8}$  (the ratio)  $= 5044200.875$ ; hence  $\sqrt[3]{5044200.875} = 171.5$  inches, the depth of the required vessel.

Also,  $125^3 = 1953125$ , the cube of the given diameter; and  $1953125 \div \frac{1}{8} = 244140.625$ ; hence

$\sqrt[3]{244140.625} = 62.5$  inches, the diameter of the required vessel.

#### EXAM. 4.

Here  $30^3 = 27000$ , the cube of the given length ; and  $27000 \times 3$  (the ratio)  $= 81000$  ; hence  $\sqrt[3]{81000} = 43.267$  inches, the length of the required cask.

Also,  $24^3 = 13824$ , the cube of the given bung diameter ; and  $13824 \times 3 = 41472$  ; hence  $\sqrt[3]{41472} = 34.614$  inches, the bung diameter of the required cask.

Lastly,  $18^3 = 5832$ , the cube of the given head diameter ; and  $5832 \times 3 = 17496$  ; hence  $\sqrt[3]{17496} = 25.96$  inches, the head diameter of the required cask.

### PROBLEM III.

*Given the dimensions and content of any vessel, to find the dimensions of a similar vessel of a given content.*

#### EXAM. 1.

Here, as  $2625 : 25^3 :: 21000 : 125000$ , the cube of the length ; and  $\sqrt[3]{125000} = 50$  inches, the length of the required vessel.

Also, as  $2625 : 15^3 :: 21000 : 27000$ , the cube of the breadth ; and  $\sqrt[3]{27000} = 30$  inches, the breadth of the required vessel.

Lastly, as  $2625 : 7^3 :: 21000 : 2744$ , the cube of the depth ; and,  $\sqrt[3]{2744} = 14$  inches, the depth of the required vessel.

#### EXAM. 2.

Here  $125.33 \times 282 = 35343.06$  cubic inches, the content of the given vessel.

Also,  $68.5 \times 282 = 19317$  cubic inches, the content of the vessel, of which the dimensions are required.

Then, as  $35343.06 : 30^3 :: 19317 : 14757.041410$ , the cube of the diameter of the said vessel; hence

$\sqrt[3]{14757.041410} = 24.52$  inches, its diameter.

Lastly, as  $35343.06 : 50^3 :: 19317 : 68819.636160$ , the cube of the depth of the said vessel; hence

$\sqrt[3]{68819.636160} = 40.88$  inches, the depth required.

### EXAM. 3.

Here  $599.45 \times 231 = 138472.95$  cubic inches, the content of the given vessel.

Also,  $946 \times 231 = 218526$  cubic inches, the content of the vessel, of which the dimensions are required.

Then, as  $138472.95 : 46^3 :: 218526 : 153607.233297$ , the cube of the bottom diameter of the said vessel; hence  $\sqrt[3]{153607.233297} = 53.55$  inches, its bottom diameter.

And, as  $138472.95 : 62^3 :: 218526 : 376108.500731$ , the cube of the top diameter of the said vessel; hence  $\sqrt[3]{376108.500731} = 72.18$  inches, its top diameter.

Lastly, as  $138472.95 : 60^3 :: 218526 : 340872.466427$ , the cube of the depth of the said vessel; hence  $\sqrt[3]{340872.466427} = 69.85$  inches, the depth required.

### EXAM. 4.

Here  $38.75 \times 282 = 10927.5$  cubic inches, the content of the given vessel.

Also,  $55.5 \times 282 = 15651$  cubic inches, the content of the vessel, whose dimensions are required.

Then, as  $10927.5 : 30^3 :: 15651 : 38670.967741$ , the cube of the length, of the said vessel; hence

$\sqrt[3]{38670.967741} = 33.82$  inches, its length.

Again, as  $10927.5 : 24^3 :: 15651 : 19799.535483$

E

the cube of the bung diameter, of the said vessel;  
hence  $\sqrt[3]{19799.535483} = 27.05$  inches, its bung  
diameter.

Lastly, as  $10927.5 : 18^3 :: 15651 : 8352.929123$   
the cube of the head diameter, of the said  
vessel; and  $\sqrt[3]{8352.929123} = 20.28$  inches, the head  
diameter required.

## PART II.

### THE USE OF THE SLIDING RULE.

#### PROBLEM I.

*Multiplication by the lines A and B.*

##### EXAM. 2.

As 1 on A : 8 on B :: 16 on A : 120 on B.

##### EXAM. 3.

As 1 on B : 24 on A :: 64 on B : 1536 on A.

##### EXAM. 4.

As 1 on A : 128 on B :: 265 on A : 33920 on B.

##### EXAM. 5.

As 1 on B : 5.8 on A :: 8.5 on B : 45.05 on A.

##### EXAM. 6.

As 1 on A : 3.5 on B :: 4.7 on A : 16.45 on B.

##### EXAM. 7.

As 1 on B : 1.7 on A :: 3.5 on B : 5.95 on A.

##### EXAM. 8.

As 1 on A : 2.4 on B :: 6.2 on A : 14.88 on B.

**EXAM. 9.**

As 1 on B : .9 on A :: 1.8 on B : 1.62 on A.

**EXAM. 10.**

As 1 on A : 32.8 on B :: 64.7 on A : 8122.16 on B.

**EXAM. 11.**

As 1 on B : .32 on A :: 86.3 on B : 27.616 on A.

**EXAM. 12.**

As 1 on A : .238 on B :: .562 on A : .133756 on B.

**PROBLEM II.**

*Division by the lines A and B.*

**EXAM. 2.**

As 7 on A : 1 on B :: 42 on A : 6 on B.

**EXAM. 3.**

As 8 on B : 1 on A :: 96 on B : 12 on A.

**EXAM. 4.**

As 24 on A : 1 on B :: 1536 on A : 64 on B.

**EXAM. 5.**

As 128 on B : 1 on A :: 33920 on B : 265 on A.

**EXAM. 6.**

As 5.3 on A : 1 on B :: 45.04 on A : 8.5 on B.

**EXAM. 7.**

As 4.7 on B : 1 on A :: 16.45 on B : 3.5 on A.

**EXAM. 8.**

As 2.4 on A : 1 on B :: 14.88 on A : 6.2 on B.

## EXAM. 9.

As .9 on B : 1 on A :: 1.62 on B : 1.8 on A.

## EXAM. 10.

As 32.8 on A : 1 on B :: 2122.16 on A : 64.7 on B.

## EXAM. 11.

As 125 on B : 1 on A :: 35 on B : .28 on A.

## EXAM. 12.

As 632 on A : 1 on B :: 15 on A : .0237 on B.

---

**PROBLEM III.**

*To find a fourth proportional to three numbers ; or  
to perform the Rule of Three by the lines A and B.*

## EXAM. 2.

*gal.*                      *s.*                      *gal.*                      *s.*  
As 44 on B : 55 on A :: 8 on B : to 10 on A.

## EXAM. 3.

*cand.*                      *lb.*                      *cand.*                      *lb.*  
As 24 on A : 1 on B :: 1200 on A : 150 on B.

## EXAM. 4.

As 12 on B : 24 on A :: 36 on B : 72 on A.

## EXAM. 5.

*bu.*                      *s.*                      *bu.*                      *s.*  
As 3.25 on A : 28.5 on B :: 8.75 on A : 76.73 on B.

## EXAM. 6.

*gal.*                      *s.*                      *gal.*                      *s.*  
As 1 on B : 19.75 on A :: 45.5 on B : 898.6 on A.

## PROBLEM IV.

*Inverse Proportion by the lines A and B.*

## EXAM. 2.

<sup>s.</sup>  
As 16 on B : <sup>gal.</sup> 8 on A :: <sup>s.</sup> 20 on B : <sup>s.</sup> 10 on A.

## EXAM. 3.

<sup>men.</sup>      <sup>da.</sup>      <sup>men.</sup>      <sup>da.</sup>  
As 48 on A : 18 on B :: 8 on A : 3 on B.

## EXAM. 4.

<sup>offi.</sup>      <sup>da.</sup>      <sup>offi.</sup>      <sup>da.</sup>  
As 6 on B : 12 on A :: 2 on B : 4 on A.

## PROBLEM V.

*To reduce a vulgar fraction to a decimal, by the lines A and B.*

## EXAM. 2.

*Den.*      *Unity.*      *Num.*      *Dec.*  
As 2 on B : 1 on A :: 1 on B : .5 on A.

## EXAM. 3.

*Den.*      *Unity.*      *Num.*      *Dec.*  
As 4 on A : 1 on B :: 3 on A : .75 on B.

## EXAM. 4.

*Den.*      *Unity.*      *Num.*      *Dec.*  
As 96 on B : 1 on A :: 24 on B : .25 on A.

**EXAM. 4.**

Set 96 on C to 96 on D, then against 486 on C, is 216 on D.

**PROBLEM XI.**

*To cube any number by the lines C and D.*

**EXAM. 2.**

Set 1 on D to 12 on C, then against 12 on D is 1728 on C.

**EXAM. 3.**

Set 1 on D to 18 on C, then against 18 on D is 5832 on C.

**EXAM. 4.**

Set 1 on D to 35 on C, then against 35 on D is 42875 on C.

**PROBLEM XII.**

*To extract the Cube Root of any number by the lines C and D.*

**EXAM. 2.**

Find 64 on the line C, then move the slide until 1 on D, 64 on C, and 10 on D, cut the same number on the opposite lines, which you will find to be 4, the root required.

**EXAM. 3.**

Having found 120 on the line C, move the slide until 1 on D, 120 on C, and 10 on D, stand against the same number on the opposite lines, which in this case is 4.93 the root required.

**EXAM. 4.**

Find 200 on the line C, then move the slide until 1 on D, 200 on C, and 10 on D, cut the same number on the opposite lines, which you will find to be 5.84, the root required.

**EXAM. 5.**

Having found 1728 on the line C, move the slide until 1 on D, 1728 on C, and 10 on D, stand against the same number on the opposite lines, which in this case is 12, the root required.

**EXAM. 6.**

Find 1000 on the line C, then move the slide until 1 on D, 1000 on C, and 10 on D, cut the same number on the opposite lines, which you will find to be 10, the root required.

---

## **PART III.**

*Problems in Practical Geometry, for the exercise of the  
Learner.*

**PROBLEM I.***Solution.*

Draw an indefinite right line with your pencil; and from any scale of equal parts, take 15 in your compasses, and transfer it to the right line; and you will have the given line AB, which you may then draw with ink. Bisect this line by Problem I. of the Gauging; and each part will measure  $7\frac{1}{2}$  if the work be right.

---

## **PROBLEM II.**

*Solution.*

Draw two lines to form any angle ABC, at pleasure; then bisect the angle by Problem II. of the Gauging; and the work will be done.

**PROBLEM III.***Solution.*

Draw the right line AB at pleasure, then take eight tenths of an inch in your compasses, and by proceeding as directed in Case 2, Problem III., you will be able to draw the line CD, parallel to the line AB, as required.

**PROBLEM IV.***Solution.*

Draw a right line at pleasure, then take in your compasses 18 inches, and lay it off upon this line; and you will obtain the given line. Take 8 inches in your compasses, and lay it off from one end of the given line, and you will obtain the point at which the perpendicular must be erected. At this point, erect the perpendicular as directed in Problem IV., and the work will be completed.

**PROBLEM V.***Solution.*

Draw a right line at pleasure, then take 24 inches in your compasses, and lay it off upon this line, and you will obtain the base of the given triangle.

With 20 in your compasses, as a radius, and one end of the base as a centre, describe an arc; and with 16 in your compasses, and the other end of the base as a centre, describe another arc, cutting the former arc; then proceed as directed in Problem VII.; and the work will be finished.

**PROBLEM VI.***Solution.*

Draw a right line at pleasure; then take 24 inches in your compasses, lay it off upon this line, and you will have the base of the triangle.

Take 14 in your compasses, and lay it off from one end of the base, and you will have the point, at which the perpendicular must be raised.

From this point, erect a perpendicular at pleasure by Problem IV.; and upon this line lay off 12 inches; proceed as directed in Problem VII., and the work will be finished.

---

**PROBLEM VII.**

*Solution.*

Draw a right line at pleasure; then take 16 inches in your compasses, and lay it off upon this line, and you will obtain one side of the square; proceed as directed in Problem IX, and you will obtain the square required.

---

**PROBLEM VIII.**

*Solution.*

Having drawn a right line at pleasure, take 24 inches in your compasses, lay it off upon this line, and you will have the length of the rectangle.

At one extremity of the line already laid down, erect a perpendicular at pleasure; then take 12 inches in your compasses, lay it off upon this line, and you will have the breadth of the rectangle.

Proceed as directed in Problem X., and you will obtain the rectangle required.

---

**PROBLEM IX.**

*Solution.*

Draw a line at pleasure; take 24 inches in your compasses, and lay it off upon this line, and you will have the base of the regular rhombus.

Proceed as directed in Problem XI., and you will be able to complete the required figure.

**PROBLEM X.***Solution.*

Having drawn a right line at pleasure, take 16 in your compasses, and lay it off upon this line, and you will have the base of the irregular rhombus.

At one end of the base, erect a perpendicular, which make equal to 12 inches; and then by proceeding as directed in Problem XII., you will be able to construct the required figure.

---

**PROBLEM XI.***Solution.*

Draw a right line at pleasure, then take 36 in your compasses, and lay it off upon this line, and you will have the base of the regular rhomboid.

Take 18 in your compasses, and lay it off from one end of the base; and by proceeding as directed in Problem XIII., you will be able to complete the required figure.

---

**PROBLEM XII.***Solution.*

Having drawn a right line at pleasure, take in your compasses 28 inches, lay it off upon this line, and you will have the transverse diameter of the ellipse.

Bisect this diameter perpendicularly, and you will obtain the centre of the figure. From this centre, set off 8 inches both ways upon the bisecting line; and you will have the conjugate diameter. Then by proceeding as directed in Problem XV., you will be able to construct the ellipse required.

**PROBLEM XIII.***Solution.*

Take 14 inches in your compasses, and with this radius, describe a circle; then apply your compasses six times to the circle, and you will have the angular points of the hexagon. Join these points by right lines, and the figure will be completed. (See Problem XVII.)

**PROBLEM XIV.***Solution.*

Draw an unlimited line at pleasure; then take  $60^{\circ}$  in your compasses, and with one end of this line as a centre, describe an arc. Take  $42^{\circ} 30'$  in the compasses, and set it off upon this arc; and by proceeding as directed in Problem XXIII., you will be able to complete the work.

**PROBLEM XV.***Solution.*

Draw the indefinite line AB; and with the chord of  $60^{\circ}$  in your compasses, describe the arc DE; set off  $90^{\circ}$  from D to C, and from C to G, set off the excess above  $90^{\circ}$ , which is  $46^{\circ} 45'$ . Draw the line AG, and GAB will be the required angle. (See Problem XXIV.)

# PART IV.

## MENSURATION OF SUPERFICIES

**EXAM. 4.**

Here  $82.2 \times 82.2 = 6756.84$ , the area in square inches ; and  $6756.84 \div 282 = 23.96$ , the area in ale gallons ; then  $23.96 \times 5.4 = 129.384$ , the content in ale gallons.

**EXAM. 5.**

Here  $43.2 \times 43.2 = 1866.24$ , the area in square inches ; and  $1866.24 \div 231 = 8.078$ , the area in wine gallons ; then  $8.078 \times 52.7 = 425.710$ , the content in wine gallons.

## EXAM. 6.

Here  $75 \times 75 = 5625$ , the area in square inches ; and  $5625 \div 2150.42 = 2.615$ , the area in malt bushels ; then  $2.615 \times 16.4 = 42.886$ , the content in malt bushels.

## EXAM. 7.

1. Here  $84 \times 84 = 7056$ , the area in square inches ; and  $7056 \div 282 = 25.021$ , the area in ale gallons ; then  $25.021 \times 14 = 350.294$ , the content in ale gallons.

2. Here  $7056 \div 231 = 30.545$ , the area in wine gallons ; and  $30.545 \times 14 = 427.63$ , the content in wine gallons.

3. Here  $7056 \div 227 = 31.083$ , the area in mash-tun gallons ; and  $31.083 \times 14 = 435.162$ , the content in mash-tun gallons.

4. Here  $7056 \div 2150.42 = 3.281$ , the area in malt bushels ; and  $3.281 \times 14 = 45.934$ , the content in malt bushels.

---

**PROBLEM II.**

*To find the area of a rectangle.*

## EXAM. 3.

*Inches.*

162.7 length.

86.8 breadth.

6.8 depth.

3988229874338.572 the content.**EXAM. 4.**

Here  $74.6 \times 65.7 = 4901.22$ , the area in square inches; and  $4901.22 \div 231 = 21.217$ , the area in wine gallons; then  $21.217 \times 24.7 = 524.0599$  gallons, the content.

**EXAM. 5.**

Here  $64 \times 52 = 3328$ , the area in square inches; and  $3328 \div 227 = 14.660$ , the area in mash-tun gallons, which, by the question, is also the area in malt gallons; then  $14.660 \times 32 = 469.12$ , the content in malt gallons; hence  $469.12 \div 8 = 58.64$ , the number of bushels required.

**EXAM. 6.**

Here  $124.5 \times 98.2 = 12225.90$ , the area in square inches; and  $12225.90 \div 2150.42 = 5.685$ , the area in malt bushels; then  $5.685 \times 14.8 = 84.138$  malt bushels, the content.

**EXAM. 7.**

Here  $245 \times 152 = 37240$ , the area in square inches; and  $37240 \div 2150.42 = 17.317$ , the area in malt bushels; then  $17.317 \times 5.9 = 102.1703$  malt bushels, the content.

**PROBLEM III.**

*To find the area of a rhombus or rhomboides.*

**EXAM. 3.**

Here  $73.6 \times 56.2 = 4136.32$ , the area in square inches; and  $4136.32 \div 282 = 14.667$ , the area in ale

gallons; then  $14.667 \times 2.7 = 39.6009$ , the content in ale gallons.

## EXAM. 4.

Here  $108.4 \times 70.6 = 7658.04$ , the area in square inches; and  $7658.04 \div 282 = 27.138$ , the area in ale gallons; then  $27.138 \times .8 = 21.7104$ , the content in ale gallons.

## PROBLEM IV.

*To find the area of a triangle, when the base and perpendicular are given.*

## EXAM. 3.

Here  $\frac{124 \times 94.7}{2} = \frac{11742.8}{2} = 5871.4$ , the area in square inches; and  $5871.4 \div 282 = 20.82$ , the area in ale gallons; then  $20.82 \times 4.1 = 85.362$ , the content in ale gallons.

## EXAM. 4.

Here  $\frac{136.7 \times 86.8}{2} = \frac{11863.56}{2} = 5932.78$ , the area in square inches; and  $5932.78 \div 2150.42 = 2.758$ , the area in malt bushels; then  $2.758 \times 42.3 = 116.6634$ , the content in malt bushels.

## PROBLEM V.

*To find the area of a triangle, when the three sides are given.*

## EXAM. 3.

Here  $\frac{114 + 112 + 98}{2} = 162$ , half the sum of the sides; then  $162 - 114 = 48$ , the first remainder;

$162 - 112 = 50$ , the second remainder; and  $162 - 98 = 64$ , the third remainder; whence  $\sqrt{162 \times 48 \times 50 \times 64} = \sqrt{24883200} = 4988.306$ , the area in square inches; then  $4988.306 \div 282 = 17.689$ , the area in ale gallons;  $4988.306 \div 231 = 21.594$ , the area in wine gallons; and  $4988.306 \div 2150.42 = 2.319$ , the area in malt bushels.

## EXAM. 4.

Here  $\frac{74 + 74 + 74}{2} = \frac{222}{2} = 111$ , half the sum of the sides; then  $111 - 74 = 37$ , the first remainder;  $111 - 74 = 37$ , the second remainder; and  $111 - 74 = 37$ , the third remainder; whence  $\sqrt{111 \times 37 \times 37 \times 37} = \sqrt{5622483} = 2371.177$ , the area in square inches; then  $2371.177 \div 282 = 8.408$ , the area in ale gallons; and  $8.408 \times 28.6 = 240.4688$ , the content in ale gallons.

## PROBLEM VI.

*To find the area of a trapezium.*

## EXAM. 3.

*Ale gallons.*

14.967 area.

3.7 depth.

$$\begin{array}{r} 104769 \\ 44901 \\ \hline 55.3779 \text{ Ans.} \end{array}$$

## EXAM. 4.

Here  $28.2 + 47 \times 94.4 = 75.2 \times 94.4 = 7098.88$ ; and  $7098.88 \div 2 = 3549.44$ , the area in square

inches ; then  $3549.44 \div 231 = 15.365$ , the area in wine gallons.

## EXAM. 5.

Here  $58.4 + 46.8 \times 126.6 = 105.2 \times 126.6 = 13318.32$  ; and  $13318.32 \div 2 = 6659.16$ , the area in square inches ; then  $6659.16 \div 2150.42 = 3.096$ , the area in malt bushels ; whence  $3.096 \times 39.3 = 121.6728$  bushels, the whole content ; and  $121.6728 -$

$\frac{121.6728}{5} = 121.6728 - 24.3345 = 97.3383$  bushels,  
the answer required.

## PROBLEM VII.

*To find the area of a trapezoid.*

## EXAM. 3.

Here  $214 + 178 \times 146 = 392 \times 146 = 57232$  ; and  $57232 \div 2 = 28616$ , the area in square inches ; then  $28616 \div 282 = 101.475$ , the area in ale gallons.

## EXAM. 4.

Here  $101.475 \times 1.7 = 172.5075$  ale gallons, the content required.

## PROBLEM VIII.

*To find the area of an irregular polygon of any number of sides.*

## EXAM. 2.

*Ale gallons.*

24.414 area.

6.7 depth.

170898

146484

163.5738 Ans.

## EXAM. 3.

Here  $\frac{160 + 102 + 94}{2} = \frac{356}{2} = 178$ , half the sum of the sides; then  $178 - 160 = 18$ , the first remainder;  $178 - 102 = 76$ , the second remainder; and  $178 - 94 = 84$ , the third remainder; whence  $\sqrt{178 \times 18 \times 76 \times 84} = \sqrt{20454336} = 4522.647$  inches, the area of the first triangle.

Again,  $\frac{160 + 130 + 64}{2} = \frac{354}{2} = 177$ , half the sum of the sides; then  $177 - 160 = 17$ , the first remainder;  $177 - 130 = 47$ , the second remainder; and  $177 - 64 = 113$ , the third remainder; whence  $\sqrt{177 \times 17 \times 47 \times 113} = \sqrt{15980799} = 3997.599$  inches, the area of the second triangle.

Also,  $\frac{140 + 130 + 100}{2} = \frac{370}{2} = 185$ , half the sum of the sides; then  $185 - 140 = 45$ , the first remainder;  $185 - 130 = 55$ , the second remainder; and  $185 - 100 = 85$ , the third remainder; whence  $\sqrt{185 \times 45 \times 55 \times 85} = \sqrt{38919375} = 6238.539$  inches, the area of the third triangle; hence we have  $4522.647 + 3997.599 + 6238.539 = 14758.785$  square inches, the area of the whole polygon.

Then,  $\frac{14758.785}{282} = 52.336$  ale gallons;  $\frac{14758.785}{231} = 63.890$  wine gallons; and  $\frac{14758.785}{2150.42} = 6.863$  malt bushels.

## EXAM. 4.

*Trapezoids on the right.*

 490406 \text{ area.} \\
 \hline
 \hline
 \end{array}$$

Then  $490406 \div 282 = 1739.028$ , the area in ale gallons;  $490406 \div 231 = 2122.969$ , the area in wine gallons; and  $490406 \div 2150.42 = 228.051$ , the area in malt bushels.

## PROBLEM IX.

*To find the area of a regular polygon.*

EXAM. 2.

*Ale gallons.*

15.603 area.

38.9 depth.

$$\begin{array}{r}
 140427 \\
 124824 \\
 46809 \\
 \hline
 606.9567 \text{ Ans.}
 \end{array}$$

EXAM. 3.

Here  $64.8 \times 5 \times 44.6 = 14450.4$ , and  $\frac{14450.4}{2} = 7225.2$ , the area in square inches; then  $7225.2 \div 282 = 25.621$ , the area in ale gallons.

EXAM. 4.

Here  $46.3 \times 7 \times 48.1 = 15589.21$ ; and  $\frac{15589.21}{2} = 7794.605$ , the area in square inches; then  $\frac{7794.605}{231} = 33.742$ , the area in wine gallons; and  $33.742 \times 48.6 = 1639.8612$ , the content in wine gallons.

## PROBLEM X.

*To find the area of a regular polygon, when the side only is given.*

EXAM. 2.

Here  $21.7 \times 21.7 \times .009213 = 470.89 \times .009213 = 4.33880957$ , the area in ale gallons; and  $4.3383 \times 41.6 = 180.47328$ , the content in ale gallons.

G

## EXAM. 3.

Here  $24.3 \times 24.3 \times .015731 = 590.49 \times .015731 = 9.2899819$ , the area in wine gallons.

## EXAM. 4.

Here  $31.2 \times 31.2 \times .002245 = 973.44 \times .002245 = 2.1853728$ , the area in malt bushels.

## PROBLEM XI.

*Given the diameter of a circle to find the circumference; or the circumference to find the diameter.*

## EXAM. 2.

Here  $265.4652 \div 3.1416 = 84.5$  inches, the diameter required.

## EXAM. 3.

Here  $36.9 \times 3.1416 = 115.92504$  inches, the circumference required.

## EXAM. 4.

Here  $86.7 \div 3.1416 = 27.5974$  inches, the diameter required.

## PROBLEM XII.

*To find the length of the arc of a circle.*

## EXAM. 2.

Here  $\frac{60 \times 8 - 96}{3} = \frac{480 - 96}{3} = \frac{384}{3} = 128$  inches, the length of the arc required.

## EXAM. 3.

*(See the figure in the Gauging.)*

Here we have given  $AD = 30$ , and  $CD = 16$ , which are the base and perpendicular of the right-

angled triangle ADC; then by Prob. IV., Part I.,  
 $\sqrt{30^2 + 16^2} = \sqrt{900 + 256} = \sqrt{1156} = 34 = AC$ ,  
 the chord of half the arc; and by the Rule,  
 $\frac{34 \times 8 - 60}{3} = \frac{272 - 60}{3} = \frac{212}{3} = 70.666$  inches, the  
 length of the arc ACB.

## EXAM. 4.

Here AC is the hypotenuse, and CD the perpendicular of a right angled triangle; then by Prob. V., Part I.,  
 $\sqrt{42.5^2 - 20^2} = \sqrt{1806.25 - 400} = \sqrt{1406.25} = 37.5 = AD$ , the base; and  $37.5 \times 2 = 75 = AB$ , the chord of the whole arc; hence by the Rule, we have  
 $\frac{42.5 \times 8 - 75}{3} = \frac{340 - 75}{3} = \frac{265}{3} = 88.333$  inches, the  
 length of the arc ACB.

## EXAM. 5.

Here  $\frac{30 \times 8 - 48}{3} = \frac{240 - 48}{3} = \frac{192}{3} = 64$ , the  
 length of the remaining arc ACB.

Also,  $3.1416 \times 50 = 157.08$ , the circumference of the circle ACBE; then  $157.08 - 64 = 93.08$  inches, the length of the required arc AEB. (See Note 2.)

## PROBLEM XIII.

*To find the area of a circle.*

## EXAM. 4.

*By Multiplication.*

Here  $38.5 \times 38.5 \times .002785 = 1482.25 \times .002785 = 4.12806625$ , the area in ale gallons;  $1482.25 \times .03399 = 5.03816775$ , the area in wine gallons;  $1482.25 \times .0346 = 5.1285850$ , the area in mash-tun gallons; and  $1482.25 \times .000365 = .54102125$ , the area in malt bushels.

## EXAM. 5.

*By Division.*

Here  $78.6 \times 78.6 \div 294.12 = 6177.96 \div 294.12 = 21.0048$ , the area in wine gallons.

*By the Table of Wine Areas.*

Having found 78 in the first column, and .6 at the top of the page; then in the common angle of meeting, we have 21.0050, the area in wine gallons.

## EXAM. 6.

*By Multiplication.*

Here  $53.2 \times 53.2 \times .002785 = 2830.24 \times .002785 = 7.8822184$ , the area in ale gallons; and  $7.8822 \times 35.7 = 281.39454$ , the content in ale gallons.

## PROBLEM XIV.

*To find the area of the sector of a circle.*

## EXAM. 2.

Here  $\frac{42.6 \times 31.5}{2} = \frac{1341.9}{2} = 670.95$ , the area in square inches; and  $670.95 \div 231 = 2.9045$ , the area in wine gallons.

## EXAM. 3.

*(See the figure in the Gauging.)*

Here we have given  $AD = 60$ , the hypotenuse, and  $DE = 36$ , one of the legs of the right-angled triangle AED, to find AE, the other leg. Then by Prob. V., Part I.,  $\sqrt{60^2 - 36^2} = \sqrt{3600 - 1296} = \sqrt{2304} = 48 = AE$ ; and  $AC - AE = 60 - 48 = 12$ , the versed sine EC.

Again, in the right-angled DEC, by Prob. IV., Part I., we have  $\sqrt{36^2 + 12^2} = \sqrt{1296 + 144} = \sqrt{1440} = 37.947 = DC$ ; the chord of half the arc; then

by Prob. XII., Part IV., we have  $\frac{37.947 \times 8 - 72}{3} = \frac{303.576 - 72}{3} = \frac{231.576}{3} = 77.192$ , the length of the arc DCB.

Lastly,  $\frac{77.192 \times 60}{2} = \frac{4631.52}{2} = 2315.76$ , the area of the sector ABCD, in square inches; and  $2315.76 \div 2150.42 = 1.0768$ , the area in malt bushels.

## EXAM. 4.

By Prob. XII., we have  $\frac{69.3 \times 8 - 124.8}{3} = \frac{55.4 - 124.8}{3} = \frac{429.6}{3} = 143.2$ , the length of the arc; then  $\frac{143.2 \times 80}{2} = \frac{11456}{2} = 5728$ , the area of the sector, in square inches; and  $5728 \div 282 = 20.312$ , the area in ale gallons; hence  $20.312 \times 8.7 = 176.7144$ , the content in ale gallons.

## PROBLEM XV.

*To find the area of the segment of a circle.*

## RULE I.

## EXAM. 2.

Here  $128 \times 32 \times \frac{2}{3} = 4096 \times \frac{2}{3} = \frac{8192}{3} = 2730.666$ , two-thirds of the product of the chord and height of the segment; and  $\frac{32^3}{128 \times 2} = \frac{32768}{256} = 128$ , the cube of the height divided by twice the chord; then  $2730.666 + 128 = 2858.666$ , the area in square inches; whence,  $2858.666 \div 282 = 10.137$ , the area in ale gallons; and  $2858.666 \div 231 = 12.375$ , the area in wine gallons.

## EXAM. 3.

By Note 2, we have  $\frac{30^2}{40} + 40 = \frac{900}{40} + 40 = 22.5 + 40 = 62.5$ , the diameter CD; then  $62.5^2 \times .7854 = 3906.25 \times .7854 = 3067.96875$ , square inches, the area of the whole circle.

Again,  $62.5 - 40 = 22.5$ , the versed sine CE; and  $22.5 \times 60 \times \frac{2}{3} = 1350 \times \frac{2}{3} = \frac{2700}{3} = 900$ , two-thirds of the product of the chord and height of the remaining segment ABC; also  $\frac{22.5^3}{60 \times 2} = \frac{11390.625}{120} = 94.921$ , the cube of the height divided by twice the chord; then  $900 + 94.921 = 994.921$  square inches, the area of the segment ABC.

Now,  $3067.96875 - 994.921 = 2073.04775$ , the area of the required segment ADB, in square inches; then  $2073.047 \div 282 = 7.351$ , the area in ale gallons;  $2073.047 \div 231 = 8.974$ , the area in wine gallons; and  $2073.04775 \div 2150.42 = .964$ , the area in malt bushels.

## RULE II.

## EXAM. 2.

Here  $\frac{32.0}{160} = .2$ , the quotient or tabular height; and the corresponding *Area Seg.* is .111823; hence  $.111823 \times 160^2 = .111823 \times 25600 = 2862.6688$ , the area of the segment, in square inches; then  $2862.668 \div 282 = 10.151$ , the area in ale gallons; and  $2862.668 \div 231 = 12.392$ , the area in wine gallons.

## EXAM. 3.

Here,  $\frac{40.0}{62.5} = .64$ , the tabular height; then  $1 - .64 = .36$ ; and the *Area Seg.* answering to .36, is .254550, which being taken from .785398, leaves .530848, the *Area Seg.* corresponding to .64; hence  $.530848 \times 62.5^2$

$= .530848 \times 3906.25 = 2073.625$ , the area of the segment in square inches; then  $2073.625 \div 282 = 7.353$ , the area in ale gallons;  $2073.625 \div 231 = 8.976$ , the area in wine gallons; and  $2073.625 \div 2150.42 = .9642$ , the area in malt bushels. (See Note 2.)

## PROBLEM XVI.

*To find the area of an ellipse.*

### EXAM. 2.

*Ale gallons.*

21.467 area.

10.8 depth.

171736

21467

231.8436 Ans.

### EXAM. 3.

Here  $85.9 \times 63.8 \div 294.12 = 5480.42 \div 294.12 = 18.633$ , the area in wine gallons.

### EXAM. 4.

Here  $96.8 \times 73.2 \div 2738 = 7085.76 \div 2738 = 2.587$ , the area in malt bushels; and  $2.587 \times 34.7 = 89.7689$ , the content in malt bushels.

### EXAM. 5.

Here  $96.4 \times 82.3 \div 359.05 = 7933.72 \div 359.05 = 22.096$ , the area in ale gallons; and  $22.096 \times 53.8 = 1188.7648$ , the content in ale gallons.

## PROBLEM XVII.

*To find the area of an elliptical segment, the base of which is parallel to either of the diameters of the ellipse.*

## EXAM. 2.

By Prob. XVI., we have  $120.8 \times 75.4 \div 294.12 = 9108.32 \div 294.12 = 30.9680$  wine gallons, the area of the whole ellipse.

By the last example, the area of the segment ACB is 1813.3298 square inches; hence  $1813.3298 \div 231 = 7.8499$ ; the area in wine gallons; then  $30.9680 - 7.8499 = 23.1181$  wine gallons, the area of the segment ADB.

## EXAM. 3.

*(See the figure in the Gauging.)*

Here  $\frac{180}{2} + 27 = 90 + 27 = 117 = DG$ , the height of the segment; then  $117 \div 180 = .650$ , the tabular height; and by Prob. XV., Rule 2, Note 2, we have  $1 - .650 = .350$ ; and the *Area Seg.* answering to .350, is 244980, which being taken from .785398, leaves .540418, the *Area Seg.* corresponding to .650; hence  $180 \times 120 \times .540418 = 21600 \times .540418 = 11673.0288$  square inches, the area of the segment ADB; and  $11673.0288 \div 2150.42 = 5.4282$ , the area in malt bushels.

## PROBLEM XVIII.

*To find the area of a parabola, its base and height being given.*

## EXAM. 2.

Here  $108.6 \times 36.2 \times \frac{2}{3} = \frac{108.6 \times 36.2 \times 2}{3}$   
 $\frac{3931.32 \times 2}{3} = \frac{7862.64}{3} = 2620.88$ , the area in square

inches; and  $2620.88 \div 231 = 11.3458$ , the area in wine gallons.

PROBLEM XIX.

*To find the area of compound figures.*

EXAM. 2.

By Prob. V., we have  $\frac{75 + 100 + 125}{2} = \frac{300}{2} = 150$ , half the sum of the sides; then,  $150 - 75 = 75$ , the first remainder;  $150 - 100 = 50$ , the second remainder;  $150 - 125 = 25$ , the third remainder; whence  $\sqrt{150 \times 75 \times 50 \times 25} = \sqrt{14062500} = 3750$ , the area of the triangle in square inches.

By Prob. XV., we have  $125 \times 26 \times \frac{2}{3} = 3250 \times \frac{2}{3} = \frac{6500}{3} = 2166.666$ , two thirds of the product of the chord and versed sine; and  $\frac{26^3}{125 \times 2} = \frac{17576}{250} = 70.304$ , the cube of the height divided by twice the chord; then  $2166.666 + 70.304 = 2236.97$ , the area of the segment in square inches.

Now,  $3750 + 2236.97 = 5986.97$ , the area of the whole compound figure; hence  $5986.97 \div 282 = 21.23$ , the area in ale gallons; and,  $21.23 \times 86 = 182.578$ , the content in ale gallons.

PROBLEM XX.

*To find the area of any curvilineal figure, by means of equidistant ordinates.*

EXAM. 6.

	<i>Inches.</i>
First ordinate .....	35.2
Last ditto .....	35.3
Sum .....	<u>70.5</u>

## EXAM. 7.

	<i>Inches.</i>
First ordinate .....	31.2
Last ditto .....	32.0
Sum ..	<u>63.2</u>

*Even ordinates.*

	<i>Inches.</i>
Second .....	50.8
Fourth .....	68.2
Sixth .....	68.8

## PROBLEM II.

*To find the content of a vessel in the form of a parallelopipedon.*

EXAM. 2.

*Inches.*

92.8 length.

64.5 breadth.

464 0

3712

5568

5985.6 0 product.

4 6.2 depth.

11971 2 0

359136 0

2394240

Divisor 282)276534.7 2 0(980.619 ale gallons.

2538

2273

2256

1747

1692

552

282

2700

2538

162

Also,  $276534.720 \div 281 = 1197.12$ , the content in wine gallons; and  $276534.720 \div 2150.42 = 128.595$ , the content in malt bushels.

EXAM. 3.

Here  $104 \times 92.4 \times 38.6 = 9609.6 \times 38.6 = 370980.56$ , the content in cubic inches; and  $370980.56 \div 281 = 1605.76$ , the content in wine gallons.

## EXAM. 4.

Hence  $1.47 \times 32 \times 11.5 = 11.422 \times 32.5 = 4781.722$   
the content in cubic inches; and  $4781.722 \div 2150.4$   
 $= 2.2239$ , the content in weak bushels.

## EXAM. 5.

Hence  $1.47 \times 11.5 \times 6.8 = 307.50 \times 6.8 = 2091.0$   
the content in cubic inches; and  $2091.00 \div 2150.4$   
 $= .97238$  the content in weak bushels.

## EXAM. 6.

(See the Note.)

By the question, the content of the vessel is 436.5  
ale gallons: and  $436.5 \times 282 = 12393$ , the content  
in cubic inches.

Also,  $83.8 \times 45.3 = 5795.14$ , the area of the base  
in inches; hence  $12393 \div 5795.14 = 52.646$  inches,  
the depth required.

## PROBLEM III.

To find the content of a vessel in the form of a prism.

## EXAM. 2.

(See Prob. X., Part IV.)

Inches.

24.5 side.

24.5 side.

1225

980

490

600.25 square of the side.

.0061 01 multiplier.

60025

60025

360150

3.66212525 area in ale gallons.

57.4 depth.

14 64850100

256 3487675

1831 062625

210.2 0598935 0 content in ale gallons.

Also,  $600.25 \times .007448 = 4.470662$ , the area of the base, in wine gallons; and  $4.470662 \times 57.4 = 256.615998$ , the content in wine gallons.

Likewise,  $600.25 \times .000800 = .4802$ , the area of the base, in malt bushels; and  $.4802 \times 57.4 = 27.56348$ , the content in malt bushels.

## EXAM. 3.

Here  $32.6 \times 32.6 = 1062.76$ , the square of the side; and  $1062.76 \times .011247 = 11.95286172$ , the area of the base, in wine gallons; then  $11.95286172 \times 49.7 = 594.057227484$ , the content in wine gallons.

## EXAM. 4.

By Prob. V., Part IV., we have  $\frac{96 + 125 + 159}{2} = \frac{380}{2} = 190$ , half the sum of the sides, then  $190 - 96 = 94$ , the first remainder;  $190 - 125 = 65$ , the second remainder; and  $190 - 159 = 31$ , the third remainder; whence  $\sqrt{190 \times 94 \times 65 \times 31} = \sqrt{35987900} = 5998.991$ , the area of the base, in inches; and  $5998.991 \div 282 = 21.273$ , the area in ale gallons; hence  $21.273 \times 33.4 = 710.5182$ , the content in ale gallons.

## EXAM. 5.

Here  $112 + 93 = 205$ , the sum of the perpendiculars; and  $\frac{205 \times 274}{2} = \frac{56170}{2} = 28085$ , the area in inches; then  $28085 \div 2150.42 = 13.060$ , the area in malt bushels; hence  $13.060 \times 39.4 = 514.564$ , the content in malt bushels.

## EXAM. 6.

By the question, the content of the vessel is 579.3 wine gallons; and  $579.3 \times 231 = 133818.3$ , the content in cubic inches.

By Prob. X., Part IV., we have  $24.6 \times 24.6 \times 4.828427 = 605.16 \times 4.828427 = 2921.97088332$ , the area of the base, in inches; then by Note 3, of this Prob. we have  $133818.3 \div 2921.97088332 = 45.797$  inches, the depth required.

### PROBLEM IV.

*To find the content of a vessel in the form of a cylinder.*

28 862612 50

477 272250 0

501.135862 50 content in wine gallons.

## EXAM. 3.

*(See Prob. V., Part IV.)**By the Rule.*

Here  $\frac{46 + 48 + 54}{2} = \frac{148}{2} = 74$ , half the sum of the three sides ; then  $74 - 46 = 28$ , the first remainder ;  $74 - 48 = 26$ , the second remainder ; and  $74 - 54 = 20$ , the third remainder ; whence  $\sqrt{74 \times 28 \times 26 \times 20} = \sqrt{1077440} = 1037.949$ , area of the base in inches ; and  $1037.949 \times 25 = 25948.725$ , the content in cubic inches ; then  $25948.725 \div 2150.42 = 12.066$ , the content in malt bushels.

## PROBLEM VI.

*To find the content of a vessel in the form of the frustum of a pyramid.*

## EXAM. 2.

*By Rule II.*

Here  $92 \times 92 = 8464$ , the square of a side of the greater end ;  $54 \times 54 = 2916$ , the square of a side of the less end ; and  $92 \times 54 = 4968$ , the product of the sides ; then  $(8464 + 2916 + 4968) \times 42 = 16348 \times 42 = 686616$ , the content in cubic inches. Hence  $686616 \times .011247 = 7722.370152$ , the content in wine gallons.

## EXAM. 3.

*By Rule II.*

Here  $85 \times 85 = 7225$ , the square of a side of the greater end ;  $28 \times 28 = 784$ , the square of a side of the less end ; and  $85 \times 28 = 2380$ , the product of the sides ; then  $(7225 + 784 + 2380) \times 94 \div 3 = 2989 \times 94 \div 3 = 280966 \div 3 = 93655.33$ , the con-

tent in cubic inches. Then  $93655.33 \times .017122 = 1603.56656026$ , the content in ale gallons;  $93655.33 \times .020902 = 1957.58370766$ , the content in wine gallons; and  $93655.33 \times .002245 = 210.25621585$  the content in malt bushels.

### PROBLEM VII.

*To find the content of a vessel in the form of a cone.*

EXAM. 2.

*By Rule I.*

By Prob. V., Part I., we have  $\sqrt{112^2 - 42^2} = \sqrt{12544 - 1764} = \sqrt{10780} = 103.826$ , the perpendicular depth of the vessel, one third of which is 34.608 inches. Then  $84^2 \times 34.608 = 7056 \times 34.608 = 2441940.480$ ; and  $2441940.480 \div 359.05 = 680.1115$ , the content in ale gallons.

EXAM. 3.

*By Rule II.*

By Note 2, Prob. XIII., Part IV., we have  $216 \times 116 \times .07958 = 46656 \times .07958 = 3712.88448$ , the area of the top, in square inches; and  $3712.88448 \div 2150.42 = 1.726$ , the area of the top in malt bushels; then  $.726 \times 32 = 55.232$ , the content in malt bushels.

### PROBLEM VIII.

*To find the content of a vessel, in the form of the frustum of a cone.*

EXAM. 2.

*By Rule I.*

*Inches.*

60 top diameter.

40 bottom diameter.

20 difference.

20 ditto.

400 square of the difference.

*Inches.*

60 top diameter.

40 bottom diameter.

3

7200 three times their product.

400 square of their difference.

7600 sum.

74 perpendicular depth.

3040053200*Divisor 1077.15* 562400 (522.118 ale gallons.53857523825021548022820021548012770010771519985010771592185086172059680

EXAM. 3.

*By Rule II.*

Here  $36 \times 40 = 1440$ , the product of the diameters; and  $\overline{40 + 36}^2 = 76^2 = 76 \times 76 = 5776$ , the square of the sum of the diameters; then  $(5776 - 1440) \times 52 = 4336 \times 52 = 225472$ ; and  $225472 \div 8214 = 27.449$ , the content in malt bushels.

## PROBLEM IX.

*To find the content of a vessel, in the form of a prismoid.*

## EXAM. 2.

Here  $42.5 \times 38.4 = 1632$ , the area of the bottom ; and  $54.6 \times 42.2 = 2304.12$ , the area of the top.

Also  $\frac{42.5 + 54.6}{2} = \frac{97.1}{2} = 48.55$ , the length of the middle section ; and  $\frac{38.4 + 42.2}{2} = \frac{80.6}{2} = 40.3$ , the breadth of the middle section ; then  $48.55 \times 40.3 \times 4 = 1956.565 \times 4 = 7826.260$ , four times the area of the middle section ; whence  $(1632 + 2304.12 + 7826.260) \times \frac{54}{6} = 11762.380 \times 9 = 105861.420$ , the content in cubic inches ; and  $105861.420 \div 282 = 375.395$ , the content in ale gallons.

## EXAM. 3.

Here  $56 \times 70 = 3920$ , the area of the top ; and  $53.8 \times 66 = 3550.8$  the area of the bottom.

Also  $\frac{70 + 66}{2} = \frac{136}{2} = 68$ , the length of the middle section ; and  $\frac{56 + 53.8}{2} = \frac{109.8}{2} = 54.9$ , the breadth of the middle section ; then  $54.9 \times 68 \times 4 = 3733.2 \times 4 = 14932.8$ , four times the area of the middle section ; whence  $(3920 + 3550.8 + 14932.8) \times \frac{48}{6} = 22403.6 \times 8 = 179228.8$ , the content in cubic inches ; and  $179228.8 \div 2150.42 = 83.345$ , the content in malt bushels.

## EXAM. 4.

Here  $\frac{49.6 + 67.2}{2} = \frac{116.8}{2} = 58.4$ , the transverse diameter of the middle section ; and  $\frac{37.8 + 50.4}{2} = \frac{88.2}{2} = 44.1$ , the conjugate diameter of the middle section.

Now,  $49.6 \times 37.8 \times .7854 = 1874.88 \times .7854 = 1472.530752$ , the area of the bottom ;  $58.4 \times 44.1 \times .7854 \times 4 = 2575.44 \times .7854 \times 4 = 2022.750576 \times 4 = 8091.002304$ , four times the area of the middle section ; and  $67.2 \times 50.4 \times .7854 = 3386.88 \times .7854 = 2660.055552$ , the area of the top ; then  $(1472.530752 + 8091.002304 + 2660.055552) \times \frac{46.8}{6} = 12223.588608 \times 7.8 = 95343.9911424$ , the content in cubic inches ; hence  $95343.991 \div 282 = 338.099$ , the content in ale gallons ; and  $95343.991 \div 231 = 412.744$ , the content in wine gallons.

## EXAM. 5.

Here  $\frac{61.6 + 42.6}{2} = \frac{104.2}{2} = 52.1$ , the transverse diameter of the middle section ; and  $\frac{46.2 + 42.6}{2} = \frac{88.8}{2} = 44.4$ , the conjugate diameter of the middle section.

Now,  $61.6 \times 46.2 \times .7854 = 2845.92 \times .7854 = 2235.185568$ , the area of the bottom,  $52.1 \times 44.4 \times .7854 \times 4 = 2313.24 \times .7854 \times 4 = 1816.818696 \times 4 = 7267.274784$ , four times the area of the middle section ; and  $42.6 \times 42.6 \times .7854 = 1814.76 \times .7854 = 1425.312504$ , the area of the top ; then  $(2235.185568 + 7267.274784 + 1425.312504) \times$

$52.6 = 10927.772856 \times 52.6 = 574800.8522256$ ; which being divided by 6, gives  $95800.1420376$ , the content in cubic inches; hence,  $95800.142 \div 282 = 339.716$ , the content in ale gallons; and  $95800.142 \div 231 = 414.719$ , the content in wine gallons.

### PROBLEM X.

*To find the content of a vessel, in the form of a sphere or globe.*

EXAM. 2.

*By Rule I.*

Here  $116^3 = 116 \times 116 \times 116 = 1560896$ , the cube of the diameter; and  $1560896 \times .5236 = 817285.1456$ , the content in cubic inches; then  $\frac{817285.1456}{282} = 2898.174$ , the content in ale gallons.

EXAM. 3.

*By Rule II.*

*By Multiplication.*

Here  $16.1^3 = 16.1 \times 16.1 \times 16.1 = 4173.281$ , the cube of the diameter; and  $4173.281 \times .000248 = 1.014107283$ , the content in malt bushels.

*By Division.*

Here  $4173.281 \div 4107 = 1.016$ , the content in malt bushels.

## PROBLEM XI.

*To find the content of a vessel, in the form of the segment of a sphere.*

EXAM. 2.

*By Rule I.*

Here  $24^2 \times 3 = 576 \times 3 = 1728$ , three times the square of the radius of the top; also  $21^2 = 441$ , the square of the depth; then  $(1728 + 441) \times 21 \times .5236 = 2169 \times 21 \times .5236 = 45549 \times .5236 = 23849.4564$ , the content in cubic inches; hence  $23849.4564 \div 231 = 103.244$ , the content in wine gallons.

EXAM. 3.

*By Rule II.*

Here  $38^2 = 1444$ , the square of the diameter of the base; and  $15^2 = 225$ , the square of the height; also  $\frac{225}{3} = 75$ , one third of the square of the height; then  $(1444 + 225 + 75) \times 7.5 = 1744 \times 7.5 = 13080$ ; and  $13080 \div 2738 = 4.777$ , the content in malt bushels.

## PROBLEM XII.

*To find the content of a vessel in the form of the frustum or zone of a sphere.*

EXAM. 2.

Here  $\frac{52^2 + 30^2}{2} = \frac{2704 + 900}{2} = \frac{3604}{2} = 1802$ , half the sum of the squares of the two diameters; and

$18^2 \times \frac{2}{3} = 324 \times \frac{2}{3} = \frac{648}{3} = 216$ , two thirds of the square of the depth; then  $1802 + 216 \times 18 = 2018 \times 18 = 36324$ ; and  $36324 \div 294.12 = 123.500$ , the content in wine gallons.

## EXAM. 3.

Here  $\frac{25^2 + 24^2}{2} = \frac{625 + 576}{2} = \frac{1201}{2} = 600.5$ , half the sum of the squares of the two diameters; and  $20^2 \times \frac{2}{3} = 400 \times \frac{2}{3} = \frac{800}{3} = 266.66$ , two thirds of the square of the altitude; then  $600.5 + 266.66 \times 20 = 867.16 \times 20 = 17343.20$ ; and  $17343.20 \div 2738 = 6.334$ , the content in malt bushels.

## PROBLEM XIII.

*To find the content of a vessel, in the form of a prolate spheroid.*

## EXAM. 2.

Here  $56^2 \times 72.5 = 3136 \times 72.5 = 227360$ ; and  $\frac{227360}{441.18} = 515.345$ , the content in wine gallons.

## EXAM. 3.

Here  $42^2 \times 48 = 1764 \times 48 = 84672$ ; and  $\frac{84672}{4107} = 20.616$ , the content in malt bushels.

## PROBLEM XIV.

*To find the content of a vessel, in the form of the middle frustum of a prolate spheroid.*

## EXAM. 2.

Middle Diameter.

$$\begin{array}{r} 24 \\ 24 \\ \hline 96 \\ 48 \\ \hline 576 \text{ square.} \end{array}$$

2

1152 twice the square of the middle diameter.

400 =  $20 \times 20$ , the square of the end diameter.

1552 sum.

25 length.

7760

3104

1077.15)38800.00(36.020 content in ale gallons.

323145

648550

646290

226000

215430

105700

## EXAM. 3.

Here  $35 \times 35 \times 2 = 1225 \times 2 = 2450$ , twice the square of the middle diameter; and  $30 \times 30 = 900$ , the square of the end diameter; then  $2450 + 900 \times 38 = 3350 \times 38 = 127300$ ; hence  $127300 \div 882.96 = 144.272$ , the content in wine gallons.

## EXAM. 4.

Here  $52 \times 52 \times 2 = 2704 \times 2 = 5408$ , twice the square of the middle diameter; and  $40 \times 40 = 1600$ , the square of the end diameter; then  $5408 + 1600 \times 58 = 7008 \times 58 = 406464$ ; hence  $406464 \div 8214 = 49.484$ , the content in malt bushels.

## PROBLEM XV.

*To find the content of a vessel, in the form of a parabolic spindle.*

## EXAM. 2.

Here  $24 \times 24 = 576$ , the square of the middle diameter; and  $576 \times 65 = 37440$ , the square of the diameter multiplied by the length; then  $37440 \div 51.48 = 67.890$ , the content in wine gallons.

## EXAM. 3.

Here  $56 \times 56 = 3136$ , the square of the middle diameter; and  $3136 \times 150 = 470400$ , the square of the diameter multiplied by the length; then  $470400 \div 5133.75 = 91.628$ , the content in malt bushels.

## PROBLEM XVI.

*To find the content of a vessel, in the form of the middle frustum of a parabolic spindle.*

## EXAM. 2.

Here  $27 \times 27 \times 8 = 729 \times 8 = 5832$ , eight times the square of the middle diameter;  $22 \times 22 \times 3 =$

$484 \times 3 = 1452$ , three times the square of the head diameter; and  $27 \times 22 \times 4 = 594 \times 4 = 2376$ , four times the product of the two diameters; then  $(5832 + 1452 + 2376) \times 30 = 9660 \times 30 = 289800$ ; and  $289800 \div 5385.79 = 53.808$ , the content in ale gallons; and  $289800 \div 4411.76 = 65.688$ , the content in wine gallons.

### EXAM. 3.

Here  $25 \times 25 \times 8 = 625 \times 8 = 5000$ , eight times the square of the middle diameter;  $20 \times 20 \times 3 = 400 \times 3 = 1200$ , three times the square of the top or bottom diameters; and  $25 \times 20 \times 4 = 500 \times 4 = 2000$ , four times the product of the two diameters; then  $(5000 + 1200 + 2000) \times 27 = 8200 \times 27 = 221400$ ; and  $221400 \div 41069.92 = 5.390$ , the content in malt bushels.

## PROBLEM XVII.

*To find the content of a vessel, in the form of a parabolic conoid.*

### EXAM. 2.

Here  $24 \times 24 = 576$ , the square of the diameter of the base; and  $576 \times 21 = 12096$ , the square of the diameter multiplied by half the altitude; then  $12096 \div 359.05 = 33.688$ , the content in ale gallons; and  $12096 \div 294.12 = 41.126$ , the content in wine gallons.

### EXAM. 3.

Here  $24 \times 24 = 576$ , the square of the diameter of the base; and  $576 \times 9 = 5184$ , the square of the diameter of the base, multiplied by half the depth;

then  $5184 \div 2738 = 1.893$ , the content in malt bushels.

---

### PROBLEM XVIII.

*To find the content of a vessel, in the form of the frustum of a parabolic conoid.*

#### EXAM. 2.

Here  $100 \times 100 = 10000$ , the square of the diameter of the greater end;  $50 \times 50 = 2500$ , the square of the diameter of the less end; and  $(10000 + 2500) \times 56 = 12500 \times 56 = 700000$ , the sum of the squares of the diameters multiplied by the depth; then  $700000 \div 718.1 = 974.794$ , the content in ale gallons; and  $700000 \div 588.24 = 1189.990$ , the content in wine gallons.

#### EXAM. 3.

Here  $28 \times 28 = 784$ , the square of the bung diameter;  $21 \times 21 = 441$ , the square of the head diameter; and  $(784 + 441) \times 36 = 1225 \times 36 = 44100$ , the sum of the squares of the two diameters multiplied by the length; then  $44100 \div 718.1 = 61.412$ , the content in ale gallons; and  $44100 \div 588.24 = 74.969$ , the content in wine gallons.

---

### PROBLEM XIX.

*To find the content of a circular vessel when its sides are a little curved.*

#### EXAM. 2.

Here  $84 \times 84 = 7056$ , the square of the bottom diameter;  $81.5 \times 81.5 = 6642.25$ , the square of the top diameter; and  $94 \times 94 \times 4 = 8836 \times 4 = 35344$ ,

four times the square of the middle diameter ; then  $(7056 + 6642,25 + 35344) \times 52 = 49042.25 \times 52 = 2550197$  ; and  $2550197 \div 2154.3 = 1183.770$ , the content in ale gallons ; and  $2550197 \div 1764.72 = 1445.100$ , the content in malt bushels.

### EXAM. 3.

Here  $30 \times 30 \times 2 = 900 \times 2 = 1800$ , twice the square of the head diameter ; and  $35 \times 35 \times 4 = 1225 \times 4 = 4900$ , four times the square of the bung diameter ; then  $(1800 + 4900) \times 38 = 6700 \times 38 = 254600$  ; and  $254600 \div 2154.3 = 118.181$ , the content in ale gallons ; and  $254600 \div 1764.72 = 144.272$ , the content in wine gallons.

## PROBLEM XX.

*To find the content of a circular vessel, when its sides are much curved, by taking five diameters at equal distances from each other.*

### EXAM. 2.

Here  $52^2 + 46^2 = 2704 + 2116 = 4820$ , the sum of the squares of the top and bottom diameters.

Also,  $63^2 \times 2 = 3969 \times 2 = 7938$ , twice the square of the middle diameter.

And,  $58^2 + 60^2 \times 4 = 3364 + 3600 \times 4 = 6964 \times 4 = 27856$ , four times the sum of the squares of the diameters, taken at one-fourth, and at three-fourths of the depth.

Then,  $(4820 + 7938 + 27856) \times 60 = 40614 \times 60 = 2436840$  ; and  $2436840 \div 4308.6 = 565.575$ , the content in ale gallons.

## EXAM. 3.

Here  $76^2 + 86^2 = 5776 + 7396 = 13172$ , the sum of the squares of the top and bottom diameters.

Also,  $104^2 \times 2 = 10816 \times 2 = 21632$ , twice the square of the middle diameter.

And,  $95^2 + 100^2 \times 4 = 9025 + 10000 \times 4 = 19025 \times 4 = 76100$ , four times the sum of the squares of the diameters taken at one-fourth, and at three-fourths of the depth.

Then,  $(13172 + 21632 + 76100) \times 82 = 110904 \times 82 = 9094128$ ; and  $9094128 \div 32856 = 276.787$ , the content of the vessel in malt bushels.

## PROBLEM XXI.

*To find the content of a circular vessel, when its sides are very much curved, by taking a competent number of equidistant, parallel sections.*

## EXAM. 2.

*By Rule II.*

	Diameters.	Areas.
	<i>Inches.</i>	<i>Ale gallons.</i>
First	93.0.....	24.0883
Second	109.5.....	33.3940
Third	120.8.....	40.6419
Fourth	128.2.....	42.2729
Fifth	124.5.....	43.1697
Sixth	117.8.....	38.6488
Seventh	108.4.....	32.7264

Then,  $34.1083 + 32.7964 = 56.8147$ , the sum of the two extreme areas;  $133.3940 + 42.2729 + 35.7057 \times 4 = 114.5152 \times 4 = 457.9608$ , four times the sum of all the even areas; and  $41.7411 + 43.1297 \times 2 = 83.8116 \times 2 = 167.6232$ , twice the sum of all the odd areas; also  $114.5 = 7 = 19.1$ , the common distance of the sections; hence,  $56.8147 + 457.9608 + 167.6232 \times \frac{19.1}{3} = \frac{251.6397 \times 19.1}{3} = \frac{13020.44517}{3} = 4340.14839$ , the content in ale gallons.

	Diameters.	Area.
	Inches.	Wine gallons.
First	93.0.....	29.4066
Second	109.5.....	40.7668
Third	130.8.....	49.6149
Fourth	143.2.....	51.6060
Fifth	154.5.....	52.7008
Sixth	117.8.....	47.1812
Seventh	108.4.....	39.9519

Then,  $29.4066 + 39.9519 = 69.3585$ , the sum of the two extreme areas;  $(40.7668 + 51.6060 + 47.1812) \times 4 = 139.5540 \times 4 = 558.2160$ , four times the sum of all the even areas; and  $(49.6149 + 52.7008) \times 2 = 102.3157 \times 2 = 204.6314$ , twice the sum of all the odd areas; hence  $(69.3585 + 558.2160 + 204.6314) \times \frac{19.1}{3} = \frac{832.2059 \times 19.1}{3} = \frac{15895.13369}{3} = 5298.57756$ , the content in wine gallons.

### EXAM. 3.

#### By Rule I.

Here  $108.4^2 \times .7854 = 11750.56 \times .7854 = 9228.889824$ , the area of the first section;  $123.6^2 \times .7854 = 15276.96 \times .7854 = 11998.594884$ , the area of the second section;  $130.8^2 \times .7854 = 17108.64 \times .7854 = 13437.125856$ , the area of the

third section;  $196.6^2 \times .7854 = 18659.56 \times .7854 = 14655.218424$ , the area of the fourth section;  $136.2^2 \times .7854 = 18550.44 \times .7854 = 14569.515576$ , the area of the fifth section;  $131.8^2 \times .7854 = 17871.24 \times .7854 = 13648.371896$ , the area of the sixth section;  $124.2^2 \times .7854 = 15425.64 \times .7854 = 12115.297656$ , the area of the seventh section;  $114.8^2 \times .7854 = 13179.04 \times .7854 = 10350.818016$ , the area of the eighth section; and  $96.8^2 \times .7854 = 9370.24 \times .7854 = 7359.386496$ , the area of the ninth or last section.

Then  $9228.889824 + 7359.386496 = 16588.276320$ , the sum of the areas of the two end sections;  $(11998.524384 + 14655.218424 + 13648.371896 + 10350.818016) \times 4 = 50647.932720 \times 4 = 202591.730880$ , four times the sum of all the even sections; and  $(13437.125856 + 14569.515576 + 12115.297656) \times 2 = 40121.939088 \times 2 = 80243.878176$ , twice the sum of all the odd sections; hence  $(16588.276320 + 202591.730880 + 80243.878176) \times \frac{18.3}{3} = 299423.885376 \times 6.1 = 1826485.7007936$ , the content in cubic inches; consequently,  $1826485.7007936 \div 282 = 6476.8996482$ , the content in ale gallons;  $1826485.7007936 \div 231 = 7906.8645056$ , the content in wine gallons; and  $1826485.7007936 \div 2150.42 = 849.36231$ , the content in malt bushels.

## PROBLEM XXII.

*To find the content of the hoof of a cylinder, or the quantity of liquor contained in a cylindrical vessel, placed in an inclining position.*

EXAM. 2.

Here  $74.4^2 = 5535.36$ , the square of the diameter of the base; and  $\frac{58.6 + 18.2}{2} = \frac{76.8}{2} = 38.4$ , half

the sum of the greatest and least depths of the liquor; then  $5535.36 \times 38.4 = 212557.824$ ; and  $212557.824 \div 294.12 = 722.690$ , the content in wine gallons.

### EXAM. 3.

Here  $63.8^2 = 4070.44$ , the square of the diameter of the base; and  $\frac{28.8 + 25.2}{2} = \frac{54}{2} = 27$ , half the sum of the greatest and least depths of the malt; then  $4070.44 \times 27 = 109901.88$ ; and  $109901.88 \div 2738 = 40.138$ , the content in malt bushels.

### EXAM. 4.

Here  $65^2 = 4225$ , the square of the diameter of the base; and  $\frac{25.8}{2} = 12.9$ , half the greatest depth of the liquor; then  $4225 \times 12.9 = 54502.5$ ; and  $54502.5 \div 359.05 = 151.796$ , the content in ale gallons.

## PROBLEM XXIII.

*To find the content of a cylindrical ungula or hoof, when its base is less than a semicircle.*

### EXAM. 2.

By Rule 1, Problem XV., Part IV., we have  $96 \times 36 \times \frac{2}{3} = 3456 \times \frac{2}{3} = \frac{6900}{3} = 2300$ , two thirds of the product of the chord and versed sine; and  $\frac{36^3}{96 \times 2} = \frac{46656}{192} = 243$ , the cube of the height divided by twice the chord; then  $2300 + 243 = 2543$  square inches, the area of the base of the hoof.

Also,  $\frac{100}{2} - 36 = 50 - 36 = 14$ , the difference between half the diameter of the vessel and the versed

sine of the hoof's base; and  $2543 \times 14 = 35602$ , the area of the base multiplied by the said difference.

Again  $48^3 \times \frac{2}{3} = 110592 \times \frac{2}{3} = \frac{221184}{3} = 73728$ , two thirds of the cube of half the chord; and  $73728 - 35602 = 38126$ ; then  $38126 \times \frac{108}{36} = 38126 \times 3 = 114378$ , the content in cubic inches; hence  $114378 \div 231 = 495.142$ , the content in wine gallons.

---

### PROBLEM XXIV.

*To find the content of a cylindrical ungula, when its base is a semicircle.*

EXAM. 2.

Here  $124 \times 124 \times \frac{126}{6} = 15376 \times 21 = 322896$ , the content in cubic inches; and  $\frac{322896}{231} = 1397.818$ , the content in wine gallons.

---

### PROBLEM XXV.

*To find the content of a cylindrical ungula, when its base is greater than a semicircle.*

EXAM. 2.

By Rule 2, Prob. XV., Part IV., we have  $64 \div 80 = .8$ , the tabular height; then by Note 2, of the same Problem,  $1 - .8 = .2$ ; and the Area Seg. answering to .2 is .111823, which being taken from .785398,

K 3.

leaves .673575, the Area Seg. corresponding to .8 ; hence  $.673575 \times 80^2 = .673575 \times 6400 = 4310.88$ , the area of the ungula's base, in square inches.

Also,  $64 - 40 = 24$ , the difference between the versed sine of the ungula's base and half the diameter of the vessel ; and  $4310.88 \times 24 = 103461.12$ , the area of the base multiplied by the said difference.

Again,  $32^3 \times \frac{2}{3} = 32768 \times \frac{2}{3} = \frac{65536}{3} = 21845.33$ , two thirds of the cube of half the chord ; and  $103461.12 + 21845.333 = 125306.453$  ; then  $125306.453 \times \frac{92}{64} = \frac{11528193.676}{64} = 180128.026$ , the content of the ungula, in cubic inches ; hence  $180128.026 \div 231 = 779.775$ , the content in wine gallons.

### PROBLEM XXVI.

*To find the content of a pyramidical ungula, or the quantity of liquor contained in a vessel in the form of the frustum of a square or rectangular pyramid, when it is placed in such a position that the liquor just covers the bottom, and rises up three of the sides in an oblique direction, forming a figure that is called a cuneus or wedge.*

EXAM. 2.

Here  $30 \times 2 + 33 = 60 + 33 = 93$ , twice the length of the base added to the length of the upper edge of the liquor ; then  $\frac{93 \times 27 \times 22}{6} = \frac{2511 \times 22}{6} = \frac{55242}{6} = 9207$ , the content of the ungula is

cubic inches; and  $\frac{9207}{231} = 39.857$ , the content in wine gallons.

## EXAM. 3.

Here  $58 \times 2 + 38 = 116 + 38 = 154$ , twice the length of the base added to the length of the upper edge of the liquor; then  $\frac{154 \times 45 \times 42}{6} = 6930 \times \frac{42}{6} = 6930 \times 7 = 48510$ , the content of the ungula in cubic inches; and  $\frac{48510}{282} = 172.021$ , the content in ale gallons.

---

**PROBLEM XXVII.**

*To find the content of a conical ungula, or the quantity of liquor contained in a vessel in the form of the frustum of a cone, when it stands upon its greater base, and in such a position that the liquor just covers the whole of its bottom.*

## EXAM. 2.

Here  $\sqrt{82.6 \times 58.7} = \sqrt{4848.62} = 69.62$ , the mean proportional between the diameters; and  $4848.62 \times 69.62 = 337560.9244$ , the product of the two diameters multiplied by the mean proportional between them.

Also,  $82.6^3 = 563559.976$ , the cube of the bottom diameter; and  $\frac{563559.976 - 337560.9244}{82.6 - 58.7} = \frac{225999.0516}{23.9} = 9456.027$ ; then  $9456.027 \times 47.3 \times .001133 = 447270.0771 \times .001133 = 506.75699735$  wine gallons, the answer required.

## PROBLEM XXVIII.

*To find the content of a conical ungula, or the quantity of liquor contained in a vessel in the form of the frustum of a cone, when it stands upon its less base, and in such a position that the liquor just covers the whole of its bottom.*

## EXAM. 2.

Here  $\sqrt{67.8 \times 42.3} = \sqrt{2867.94} = 53.553$ , the mean proportional between the diameters; and  $2867.94 \times 53.553 = 153586.79082$ , the product of the two diameters multiplied by the mean proportional between them.

Also  $42.3^3 = 75686.967$ , the cube of the bottom diameter; and  $\frac{153586.79082 - 75686.967}{67.8 - 42.3} =$

$\frac{77899.82382}{25.5} = 3054.895$ ; then  $3054.895 \times 54.6 \times .0009283 = 166797.267 \times .0009283 = 154.8379029561$  ale gallons, the content required.

## PROBLEM XXIX.

*To find the quantity of liquor contained in a conical vessel, placed in an inclining position so that the liquor intersecting the opposite sides of the vessel, in an oblique direction, disposes itself into a compound figure, consisting of the frustum of a cone, and a conical ungula.*

## EXAM. 2.

*To find the content of the frustum.*

By Rule 2, Prob. VIII., we have  $40 \times 30 = 1200$ , the product of the diameters; and  $40 + 30 = 70$

$70^2 = 70 \times 70 = 4900$ , the square of the sum of the diameters; then  $(4900 - 1200) \times 20 = 3700$   
 $\times 20 = 74000$ ; and  $74000 \div 882.36 = 83.865$ ,  
 the content in wine gallons.

*To find the content of the ungula.*

By Prob. XXVIII., we have  $\sqrt{50 \times 40} = \sqrt{2000}$   
 $= 44.721$ , the mean proportional between the diameters; and  $44.721 \times 2000 = 89442$ , the product of the two diameters multiplied by the mean proportional between them.

Also,  $40^3 = 64000$ , the cube of the bottom diameter; and  $\frac{89442 - 64000}{50 - 40} = \frac{25442}{10} = 2544.2$ ;  
 then  $2544.2 \times 20 \times .001133 = 50884 \times .001133$   
 $= 57.651572$ , the content in wine gallons.

Lastly,  $83.865 + 57.651572 = 141.516572$  wine gallons, the content of the whole compound figure.

### PROBLEM XXX.

*To find the quantity of liquor contained in a vessel in the form of the frustum of a cone, when it is placed on its greater end, and such a position that the liquor, covering only part of its bottom, forms an elliptic ungula.*

EXAM. 2.

Here  $60 - 50 = 10$ , the difference of the diameters; and  $\frac{40 - 10}{50} = \frac{30}{50} = .6$ , the quotient obtained by subtracting the difference of the diameters from the versed sine of the base, and dividing the remainder by the less diameter. The Area Seg. answering to this quotient is .492029.

Now,  $50^3 = 125000$ , the cube of the less diameter; also,  $\frac{40}{40 - 10} = \frac{40}{30} = 1.333$ , the quotient arising

from dividing the versed sine of the base by the difference between the said versed sine and the difference of the diameters; and  $\sqrt{1.333} = 1.154$ , the square root of the said quotient; then  $.492029 \times 125000 \times 1.333 \times 1.154 = 61503.625 \times 1.333 \times 1.154 = 81984.332125 \times 1.154 = 94609.91927225$ , the reserved product.

Again,  $60^3 = 216000$ , the cube of the bottom diameter; and  $\frac{40}{60} = .666$ , the quotient of the versed sine of the base divided by the bottom diameter. The area segment answering to this quotient is  $.555597$ ; then  $.555597 \times 216000 = 120008.952$ , the product arising from multiplying the last Area Seg. by the cube of the bottom diameter.

Now,  $120008.952 - 94609.919 = 25399.033$ , the difference between the last product and the reserved product; also  $\frac{54}{3} = 18$ , one-third of the perpendicular height of the ungula; then  $25399.033 \times \frac{18}{10} = \frac{457182.594}{10} = 45718.2594$ , the content of the ungula, in cubic inches; and  $\frac{45718.259}{231} = 197.914$ , the content in wine gallons.

### PROBLEM XXXI.

*To find the quantity of liquor, contained in a vessel in the form of the frustum of a cone, when it is placed on its less end, and in such a position that the liquor, covering only part of its bottom, forms an elliptic ungula.*

EXAM. 2.

$$\text{Here } \frac{110 - 80 + 36}{110} = \frac{30 + 36}{110} = \frac{66}{110}$$

= .6. The Area Seg. answering to the quotient is .492029; and  $.492029 \times 110^3 = .492029 \times 1331000 = 654890.599$ , the first number.

Again,  $\frac{36}{36 + 30} = \frac{36}{66} = .545$ ; and  $\sqrt{.545} = .738309$ ;  $.738309 \times 161878625 = .40234$ , the second number.

Again,  $\frac{36}{80} = .45$ . The Area Seg. answering to this quotient is .342782; and  $.342782 \times 80^3 = .342782 \times 512000 = 175504.384$ , the third number.

Again,  $\frac{42}{30 \times 3} = \frac{42}{90} = .4666$ , the fourth number.

Now,  $654890.599 \times .40234 = 263488.68360166$ , the product of the first and second numbers; then  $263488.68360166 - 175504.384 = 87984.29960166$ ;  $87984.29960166 \times .4666 = 41053.471996334556$ , the content of the ungula, in cubic inches; and  $\frac{41053.472}{282} = 145.579$ , the content in ale gallons.

## PROBLEM XXXII.

*To find the quantity of liquor, contained in a vessel in the form of the frustum of a cone, when it is placed on its greater end, and in such a position that the liquor, covering only part of its bottom, forms a parabolic ungula.*

### EXAM. 2.

Here  $100 - 74 = 26$ , the versed sine of the base of the ungula; and  $\frac{26}{100} = .26$ . The Area Seg.

answering to this quotient is .162263 ; then  $.162263 \times 100^2 = .162263 \times 10000 = 1622.63$ , the area of the base of the ungula ; and  $\frac{1622.63 \times 100}{26} = \frac{162263}{26} = 6240.884$  the reserved quotient.

Again,  $\sqrt{26 \times 74 \times 74 \times \frac{4}{3}} = \sqrt{1924 \times 296} = 43.863 \times \frac{296}{3} = \frac{12983.448}{3} = 4327.816$ .

Then  $(6240.884 - 4327.816) \times \frac{34.5}{3} = 1913.068 \times 11.5 = 22000.282$ , the content of the ungula, in cubic inches ; and  $\frac{22000.282}{231} = 95.239$ , the content in wine gallons.

### PROBLEM XXXIII.

*To find the quantity of liquor contained in a vessel in the form of the frustum of a cone, when it is placed upon its greater end, and in such a position that the liquor, covering only part of its bottom, forms a hyperbolic ungula.*

EXAM. 2.

CALCULATION.

*To find the transverse and conjugate diameters of the hyperbolic section.*

Here  $64 \times 60 = 3840$ , the reserved product ; and  $96 - (60 + 30) = 96 - 90 = 6$  ; then  $\frac{3840}{6} = 640$ , the transverse diameter.

Again,  $\sqrt{80 \div 6} = \sqrt{5} = 2.236$  ; and  $2.236 \times 60 = 134.16$ , the conjugate diameter.

*To find the area of the hyperbolic section.*

$$\begin{aligned} \text{Here } 21 \sqrt{640 \times 64 + 64^2 \times \frac{1}{4}} &= 21 \sqrt{40960} \\ + 4096 \times \frac{1}{4} &= 21 \sqrt{40960 + 20480 \div 7} = 21 \\ \sqrt{40960 + 292.5714} &= 21 \sqrt{41252.5714} = 203.11 \\ &= 21 = 4265.31. \end{aligned}$$

$$\begin{aligned} \text{Again, } (4 \sqrt{640 \times 64} + 4265.31) \div 75 &= \\ (4 \sqrt{40960} + 4265.31) \div 75 &= (4 \times 202.385 + \\ 4265.31) \div 75 &= (809.54 + 4265.31) \div 75 = \\ 5074.85 \div 75 &= 67.664. \end{aligned}$$

$$\begin{aligned} \text{Lastly, } \frac{134.16 \times 64 \times 4}{640} \times 67.664 &= \frac{8586.24 \times 4}{640} \\ \times 67.664 &= \frac{34844.96}{640} \times 67.664 = 53.664 \times 67.664 \\ &= 3631.120896, \text{ the area of the section.} \end{aligned}$$

*To find the area of the circular segment of the base.*

$$\begin{aligned} \text{Here } \frac{30}{96} &= .3125, \text{ the tabular height. The Area} \\ \text{eg. answering to this quotient, is } .20969; \text{ then} \\ .0969 \times 96^2 &= .20969 \times 9216 = 1932.50304, \\ \text{the area of the base.} \end{aligned}$$

*To find the content of the hyperbolic ungula.*

$$\text{Here } \frac{63 \div 3}{96 - 60} = \frac{21}{36} = .5833, \text{ the first num-}$$

r.

$$\text{Again, } 1932.50304 \times 96 = 185520.29184, \text{ the}$$

cond number.

$$\begin{aligned} \text{Again, } \frac{60 \times 30}{64} \times 3631.120896 &= \frac{1800}{64} \times \\ 3631.120896 &= 28.125 \times 3631.120896 = 102125.2752, \\ \text{the third number.} \end{aligned}$$

$$\begin{aligned} \text{Then, } (185520.29184 - 102125.2752) \times \\ 33 &= 83395.01664 \times .5833 = 48644.313206112, \text{ the} \\ \text{content in cubic inches; and } 48644.3132 \div 282 &= \\ 172.4975, \text{ the content in ale gallons.} \end{aligned}$$

L

## MISCELLANEOUS EXAMPLES

IN THE

*MENSURATION*

OF

SUPERFICIES AND SOLIDS,

APPLIED TO

GAUGING.

## EXAM. 1.

By Problem I., Part I., Square Root, we have  
 $\sqrt{81 \times 64} = \sqrt{5184} = 72$  inches, the depth  
 required.

## EXAM. 2.

By Prob. II., Part I., we have  $\sqrt{59536} = 244$   
 inches, the side of the square required.

## EXAM. 3.

By Prob. III., Part I., we have  $6432 \div .7854 =$   
 $8189.457601$ ; and  $\sqrt{8189.457601} = 90.495$  inches,  
 the diameter required.

## EXAM. 4.

By Prob. IV., Part I., we have  $\sqrt{78^2 + 112^2}$   
 $= \sqrt{6084 + 12544} = \sqrt{18628} = 136.484$  inches.  
 the diagonal required.

## EXAM. 5.

Here a perpendicular drawn from the middle of the given diagonal of the opposite angle, will be equal to half the said diagonal; consequently, we have the base and perpendicular of an isosceles right-angled triangle given, to find the hypotenuse, as in the last Example; hence  $\sqrt{57.5^2 + 57.5^2} = \sqrt{3306.25 + 3306.25} = \sqrt{6612.50} = 81.317$  inches, the side required.

## EXAM. 6.

By Prob. V., Part I., we have  $\sqrt{145^2 - 116^2} = \sqrt{21025 - 13456} = \sqrt{7569} = 87$  inches, the breadth required.

## EXAM. 7.

By Prob. VI., Part I., we have  $\frac{36 + 27}{2} = \frac{63}{2}$   
 $= 31.5$ , half the sum of the diameters; then  $\sqrt{31.5^2 + 22.5^2} = \sqrt{992.25 + 506.25} = \sqrt{1498.50} = 38.71$  inches, the diagonal required.

## EXAM. 8.

By Prob. VII., Part I., we have  $\frac{38.7 + 29.6}{2} = \frac{68.3}{2}$   
 $= 34.15$ , half the sum of the diameters; then  $2\sqrt{40.3^2 - 34.15^2} = 2\sqrt{1624.09 - 1166.2225} = 2\sqrt{457.8675} = 21.39 \times 2 = 42.78$  inches, the length required.

## EXAM. 9.

By Problem I., Part I., Cube Root, we have  
 $\sqrt[3]{254 \times 292} = \sqrt[3]{71628} = 41.52$  inches, the side required.

## EXAM. 10.

By Prob. II., Part I., we have  $\sqrt[3]{125^3 \times 5} \sqrt[3]{1953125}$   
 $\times 5 = \sqrt[3]{9765625} = 213.74$  inches, the length of the required vessel.

Again,  $\sqrt[3]{86^3 \times 5} = \sqrt[3]{636056 \times 5} = \sqrt[3]{3180280}$   
 $= 147.05$  inches, the breadth of the required vessel.

Lastly,  $\sqrt[3]{62^3 \times 5} = \sqrt[3]{238328 \times 5} = \sqrt[3]{1191640}$   
 $= 106.01$  inches, the depth of the required vessel.

## EXAM. 11.

By Problem II., Part I., we have  $\sqrt[3]{254^3 \div 3} =$   
 $\sqrt[3]{16387064 \div 3} = \sqrt[3]{5462354.666666} = 176.11$   
inches, the depth of the required vessel.

Also,  $\sqrt[3]{112^3 \div 3} = \sqrt[3]{1404928 \div 3} =$   
 $\sqrt[3]{468309.333333} = 77.64$  inches, the diameter of the required vessel.

## EXAM. 12.

By Prob. III., Part I., as  $121500 : 75^3 :: 562500$   
 $: 1953125$ , the cube of the length; and  $\sqrt[3]{1953125}$   
 $= 125$  inches, the length of the required vessel.

Again,  $121500 : 45^3 :: 562500 : 421875$ , the  
cube of the breadth; and  $\sqrt[3]{421875} = 75$  inches, the  
breadth of the required vessel.

Lastly, as  $121500 : 36^3 :: 562500 : 216000$ ,  
the cube of the depth; and  $\sqrt[3]{216000} = 60$  inches,  
the depth of the required vessel.

## EXAM. 13.

By Prob. I., Part IV., we have  $62.8 \times 62.8 =$   
 $3943.84$ , the area in square inches; and  $\frac{3943.84}{282} =$   
 $13.981$ , the area in ale gallons.

## EXAM. 14.

By Prob. II., Part IV., we have  $115.3 \times 86.4 =$   
 $9961.92$ , the area in square inches;  $\frac{9961.92}{231} =$   
 $43.125$ , the area in wine gallons.

## EXAM. 15.

By Prob. III., Part IV., we have  $84.6 \times 63.4 =$   
 $5363.64$ , the area in square inches; and  $\frac{5363.64}{2150.42} =$   
 $2.494$ , the area in malt bushels.

## EXAM. 16.

By Prob. IV., Part IV., we have  $123.6 \times 42.85 =$   
 $5296.260$ , the area in square inches; and  $\frac{5296.260}{282} =$   
 $18.781$ , the area in ale gallons.

## EXAM. 17.

By Prob. V., Part IV., we have  $\frac{56 + 68 + 79}{2} =$   
 $\frac{203}{2} = 101.5$ , half the sum of the sides; then  $101.5$   
 $- 56 = 45.5$  the first remainder;  $101.5 - 68 =$

33.5 the second remainder; and  $101.5 - 79 = 22.5$  the third remainder; whence  $\sqrt{101.5 \times 45.5 \times 33.5 \times 22.5} = \sqrt{3481005.9375} = 1865.745$ , the area in square inches; and  $\frac{1865.745}{231} = 8.076$ , the area in wine gallons.

## EXAM. 18.

By Prob. VI., Part IV., we have  $63.8 + 56.4 \times 138.6 = 120.2 \times 138.6 = 16659.72$ ; and  $\frac{16659.72}{2} = 8329.86$ , the area in square inches; then  $\frac{8329.86}{2150.42} = 3.875$ , the area in malt bushels.

## EXAM. 19.

By Prob. VII., Part IV., we have  $98 + 124 \times 136 = 222 \times 136 = 30192$ ; and  $30192 \div 2 = 15096$ , the area in square inches; then  $15096 \div 287 = 53.531$ , the area in ale gallons.

## EXAM. 20.

(See Problems V. and VIII., Part IV.)

Here  $\frac{122 + 104 + 168}{2} = \frac{394}{2} = 197$ , half the sum of the sides; then  $197 - 122 = 75$ , the first remainder;  $197 - 104 = 93$ , the second remainder; and  $197 - 168 = 29$ , the third remainder; whence  $\sqrt{197 \times 75 \times 93 \times 29} = \sqrt{39848175} = 6312.541$  inches, the area of the first triangle.

Again,  $\frac{168 + 114 + 112}{2} = \frac{394}{2} = 197$ , half the sum of the sides; then  $197 - 168 = 29$ , the first remainder;  $197 - 114 = 83$ , the second

remainder; and  $197 - 112 = 85$ , the third remainder; whence  $\sqrt{197 \times 29 \times 83 \times 85} = \sqrt{40305215} = 6348.638$  inches, the area of the second triangle.

Also,  $\frac{114 + 87 + 92}{2} = \frac{293}{2} = 146.5$ , half the sum of the sides; then  $146.5 - 114 = 32.5$ , the first remainder;  $146.5 - 87 = 59.5$ , the second remainder;  $146.5 - 92 = 54.5$ , the third remainder; whence  $\sqrt{146.5 \times 32.5 \times 59.5 \times 54.5} = \sqrt{154395434.75} = 3929.318$  inches, the area of the third triangle; hence we have  $6312.541 + 6348.638 + 3929.318 = 16590.497$  square inches, the area of the whole polygon.

Then,  $\frac{16590.497}{2150.42} = 7.715$ , the area in malt bushels; and  $7.715 \times 6.4 = 49.376$ , the content in malt bushels.

## EXAM. 21.

By Prob. IX., Part IV., we have  $52.6 \times 8 \times 63.7 = 26804.96$ , and  $\frac{26804.96}{2} = 13402.48$ , the area in square inches; and  $13402.48 \div 231 = 58.019$ , the area in wine gallons; then,  $58.019 \times 84.3 = 4891.0017$ , the content in wine gallons.

## EXAM. 22.

By Prob. X., Part IV., we have  $87.6 \times 87.6 \times .021921 = 7673.76 \times .021921 = 168.21649296$ , the area in ale gallons.

## EXAM. 23.

By Prob. XIII., Part IV., we have  $226.4 \times 226.4 \div 359.05 = 51256.96 \div 359.05 = 142.757$ , the area of the base in ale gallons; and  $142.757 \times 253.8 = 36945.5116$ , the content in ale gallons.

## EXAM. 24.

(See the Figure in Problem XIV., Part IV., of the Gauging.)

By the question,  $AD = 52$ , and  $DE = 43$ ; then by Prob. V., Part I., we have  $\sqrt{52^2 - 43^2} = \sqrt{2704 - 1849} = \sqrt{855} = 29.24 = AE$ ; and  $AC - AE = 52 - 29.24 = 22.76$ , the versed sine EC.

Again, by Prob. IV., Part I., we have  $\sqrt{43^2 + 22.76^2} = \sqrt{1849 + 518.0176} = \sqrt{2367.0176} = 48.653 = DC$ , the chord of half the arc.

Again, by Prob. XII., Part IV., we have  $\frac{48.653 \times 8 - 86}{3} = \frac{389.224 - 86}{3} = \frac{303.224}{3} = 101.0746$ , the length of the arc DCB.

Lastly, by Problem XIV., Part IV., we have  $\frac{101.0746 \times 52}{2} = \frac{5255.8792}{2} = 2627.9396$ , the area of the sector ABCD, in square inches; and  $2627.9396 \div 231 = 11.3763$ , the area in wine gallons.

## EXAM. 25.

By Prob. XV., Part IV., we have  $92 \times 38 \times \frac{2}{3} = 3496 \times \frac{2}{3} = \frac{6992}{3} = 2330.6$ , two-thirds of the product of the chord and versed sine, or height of the segment; and  $\frac{38^3}{92 \times 2} = \frac{54872}{184} = 298.217$ , the cube of the height divided by twice the chord, then  $2330.6 + 298.217 = 2628.817$ , the area in square inches; and  $2628.817 \div 282 = 9.322$ , the area in ale gal-

lons; whence  $9.322 \times 6.4 = 59.6608$ , the content in ale gallons.

## EXAM. 26.

By Prob. XVI., Part IV., we have  $125.4 \times 82.8 \div 2738 = 10383.12 \div 2738 = 3.792$ , the area in malt bushels.

## EXAM. 27.

By Prob. XVII., Part IV., we have  $\frac{21.8}{52.4} = 416\frac{1}{11}$ , the tabular height; and the corresponding *Area Seg.* is .309125; then  $.309125 \times 65.6 \times 52.4 = 1062.59864$ , the area of the segment in square inches; and  $\frac{1062.59864}{282} = 3.76808$ , the area in ale gallons.

## EXAM. 28.

By Prob. XVIII., Part IV., we have  $98.6 \times 75.4 \times \frac{98.6 \times 75.4 \times 2}{3} = \frac{7454.44 \times 2}{3} = \frac{14868.88}{3} = 4956.293$ , the area in square inches; and  $4956.293 \div 231 = 21.455$ , the area in wine gallons.

## EXAM. 29.

By Prob. IV., Part I., we have  $\sqrt{80^2 + 60^2} = \sqrt{6400 + 3600} = \sqrt{10000} = 100$  inches, the hypotenuse or chord of the segment.

Then, by Prob. V., Part IV., we have  $\frac{80 \times 60}{2} = \frac{4800}{2} = 2400$ , the area of the triangle in square inches.

Again, by Prob. XV., Rule I., Part IV., we have

$100 \times 25 \times \frac{2}{3} = 2500 \times \frac{2}{3} = \frac{5000}{3} = 1666.666$ ,  
 two-thirds of the product of the chord and versed sine,  
 or height of the segment; and  $\frac{25^3}{100 \times 2} = \frac{15625}{200}$   
 $= 78.125$ , the cube of the height divided by twice  
 the chord; then  $1666.666 + 78.125 = 1744.791$ , the  
 area of the segment in square inches.

Now,  $2240 + 1744.791 = 3984.791$ , the area of  
 the cooler in square inches, and  $3984.791 \div 282 =$   
 $14.13$ , the area in ale gallons; whence  $14.13 \times 94$   
 $= 132.822$ , the content in ale gallons. (See Prob.  
 XIX., Part IV.)

## EXAM. 30.

By Prob. XX., Part IV., we have  $49.5 + 49.6 =$   
 $99.1$ , the sum of the first and last ordinates;  $(51.4 +$   
 $52.6 + 52.7 + 51.5) \times 4 = 208.2 \times 4 = 832.8$ ,  
 four times the sum of the even ordinates;  $(52.2 +$   
 $53.2 + 52.3) \times 2 = 157.7 \times 2 = 315.4$ , twice  
 the sum of the odd ordinates; and  $97.6 \div 8 = 12.2$ ,  
 the common distance of the ordinates; then,  $(99.1 +$   
 $832.8 + 315.4) \times \frac{12.2}{3} = 1247.3 \times \frac{12.2}{3} = \frac{15217.06}{3}$   
 $= 5072.353$ , the area in square inches; hence  
 $5072.353 \div 231 = 21.958$ , the area in wine  
 gallons.

## EXAM. 31.

By Prob. I., Part V., we have  $64.3 \times 64.3 \times 64.3$   
 $= 4134.49 \times 64.3 = 265847.707$ , the content in  
 cubic inches; hence  $265847.707 \div 282 = 942.722$ ,  
 the content in ale gallons; and  $265847.707 \div 231 =$   
 $1150.855$ , the content in wine gallons.

## EXAM. 32.

By Prob. II., Part V., we have  $145 \times 96 \times 84 =$   
 $13920 \times 84 = 1169280$ , the content in cubic inches:

and  $1169280 \div 282 = 4146.382$ , the content in ale gallons.

### EXAM. 33.

By Prob. X., Part IV., we have  $86.4 \times 86.4 \times .001689 = 7464.96 \times .001689 = 12.60831744$ , the area of the base in malt bushels; and by Prob. III., Part V.,  $12.60831744 \times 73.6 = 927.972163584$ , the content in malt bushels.

### EXAM. 34.

By Prob. V., Part I., we have  $95^2 - 76^2 = 9025 - 5776 = 3249$ , the square of the diameter of the base; then by Prob. IV., Part V.,  $3249 \times 76 \div 359.05 = 246924 \div 359.05 = 687.714$ , the content in ale gallons.

### EXAM. 35.

By Prob. X., Part IV., we have  $53.8 \times 53.8 \times .001875 = 2894.44 \times .001875 = 5.42707500$ , the area of the top in wine gallons; and by Note 4, Prob. V., Part V.,  $5.42707500 \times 20.8 = 112.883$ , the content in wine gallons.

### EXAM. 36.

By Rule II., Prob. VI., Part V., we have  $45.7 \times 45.7 = 2088.49$ , the square of a side of the greater end;  $34.3 \times 34.3 = 1176.49$ , the square of a side of the lesser end; and  $45.7 \times 34.3 = 1567.51$ , the product of the sides; then  $(2088.49 + 1176.49 + 1567.51) \times 22.8 = 4832.49 \times 22.8 = 110180.772$ , the content in cubic inches. Hence  $110180.772 \times .0008 = 88.1446176$ , the content in malt bushels.

### EXAM. 37.

By Prob. V., Part I., we have  $2 \sqrt{85^2 - 75^2} = 2 \sqrt{7225 - 5625} = 2 \sqrt{1600} = 40 \times 2 = 80$ , the diameter of the top; then by Rule I., Prob. VII.,

Part V.,  $(80 \times 80 \times 25) \div 359.05 = 160000 \div 359.05 = 445.62$ , the content in ale gallons.

## EXAM. 38.

By Rule I., Prob. VIII., Part V., we have  $126.3 \times 158.6 \times 3 = 20031.18 \times 3 = 60093.54$ , three times the product of the diameter.

Also  $158.6 - 126.3 = 32.3$ , the difference of the diameters; and  $32.3 \times 32.3 = 1043.29$ , the square of the difference; then  $(60093.54 + 1043.29) \times 132.7 = 61136.83 \times 132.7 = 8112857.341$ ; and  $8112857.341 \div 882.86 = 9194.898$ , the content in wine gallons.

## EXAM. 39.

By Prob. IX., Part V., we have  $82.4 \times 42.6 = 3510.24$ , the area of the bottom; and  $104.2 \times 54.8 = 5710.16$ , the area of the top.

Also  $\frac{82.4 + 104.2}{2} = \frac{186.6}{2} = 93.3$ , the length of the middle section; and  $\frac{42.6 + 54.8}{2} = \frac{97.4}{2} = 48.7$ , the breadth of the middle section; then  $93.3 \times 48.7 \times 4 = 4543.71 \times 4 = 18174.84$ , four times the area of the middle section; whence  $(3510.24 + 5710.16 + 18174.84) \times \frac{112.2}{6} = 27395.24 \times 18.7 = 512290.988$ , the content in cubic inches; and  $512290.988 \div 2150.42 = 238.228$ , the content in malt bushels.

## EXAM. 40.

By Prob. IX., Part V., we have  $\frac{99.2 + 134.4}{2} = \frac{233.6}{2} = 116.8$ , the transverse diameter of the middle

section; and  $\frac{75.6 + 100.8}{2} = \frac{176.4}{2} = 88.2$ , the conjugate diameter of the middle section.

Now  $99.2 \times 75.6 \times .7854 = 7499.52 \times .7854 = 5890.123008$ , the area of the bottom;  $116.8 \times 88.2 \times .7854 \times 4 = 10301.76 \times .7854 \times 4 = 8091.002304 \times 4 = 32364.009216$ , four times the area of the middle section; and  $134.4 \times 100.8 \times .7854 = 13547.52 \times .7854 = 10640.222208$ , the area of the top; then  $(5890.123008 + 32364.009216 + 10640.222208) \times \frac{93.6}{6} = 48894.354432 \times 15.6 = 762751.9291392$ , the content in cubic inches; hence  $762751.929 \div 282 = 2704.794$ , the content in ale gallons.

## EXAM. 41.

By Rule II., Prob. X., Part V., we have  $52.4 \times 52.4 \times .00227 = 2745.76 \times 52.4 \times .00227 = 143877.824 \times .00227 = 326.60266048$ , the content in wine gallons.

## EXAM. 42.

By Rule I., Prob. XI., Part V., we have  $17.8 \times 17.8 \times 3 = 316.84 \times 3 = 950.52$ , three times the square of half the top diameter; also  $15.8 \times 15.8 = 249.64$ , the square of the depth; then  $(950.52 + 249.64) \times 15.8 \times .5236 = 1200.16 \times 15.8 \times .5236 = 18962.528 \times .5236 = 9928.7796608$ , the content in cubic inches; hence  $9928.779 \div 282 = 35.208$ , the content in ale gallons.

## EXAM. 43.

By Rule II., Prob. XI., Part V., we have  $53.8 \times 53.8 = 2894.44$ , the square of the diameter of the base; and  $32.7 \times 32.7 = 1069.29$ , the square of the depth; also  $\frac{1069.29}{3} = 356.43$ , one-third of the

square of the depth; then  $(2894.44 + 1069.29 + 356.43) \times 16.35 = 4320.16 \times 16.35 = 70634.616$ ; and  $70634.616 \div 294.12 = 240.155$ , the content in wine gallons.

## EXAM. 44.

By Prob. XII., Part V., we have  $\frac{72^2 + 84^2}{2} = \frac{5184 + 7056}{2} = \frac{12240}{2} = 6120$ , half the sum of the squares of the two diameters; and  $60^2 \times \frac{1}{3} = 3600 \times \frac{1}{3} = \frac{7200}{3} = 2400$ , two-thirds of the square of the depth; then  $(6120 + 2400) \times 60 = 8520 \times 60 = 511200$ ; and  $511200 \div 2738 = 186.705$ , the content in malt bushels.

## EXAM. 45.

By Prob. XIII., Part V., we have  $82 \times 82 \times 96 = 6724 \times 96 = 645504$ ; and  $645504 \div 538.58 = 1198.529$ , the content in ale gallons.

## EXAM. 46.

By the Remark at the end of Prob. XIII., Part V., we have  $(40 \times 40 \times 28) \div 441.18 = (1600 \times 28) \div 441.18 = 44800 \div 441.18 = 101.545$ , the content in wine gallons.

## EXAM. 47.

By Prob. XIV., Part V., we have  $48 \times 48 \times 2 = 2304 \times 2 = 4608$ , twice the square of the middle diameter,  $40 \times 40 = 1600$ , the square of the end diameter; and  $4608 + 1600 \times 50 = 6208 \times 50 = 310400$ ; hence  $310400 \div 1077.15 = 288.167$ , the content in ale gallons.

## EXAM. 48.

By the Remark at the end of Prob. XIV., Part V., we have  $72 \times 72 \times 2 = 5184 \times 2 = 10368$ , twice the square of the greater diameter; and  $54 \times 54 = 2916$ , the square of the less diameter; then  $10368 + 2916 \times 80 = 13284 \times 80 = 1062720$ ; hence  $1062720 \div 882.36 = 1204.406$ , the content in wine gallons.

## EXAM. 49.

By Prob. XV., Part V., we have  $50 \times 50 \times 80 = 2500 \times 80 = 200000$ , the square of the middle diameter, multiplied by the length; then  $200000 \div 673.22 = 297.079$ , the content in ale gallons.

## EXAM. 50.

By Prob. XVI., Part V., we have  $50 \times 50 \times 8 = 2500 \times 8 = 20000$ , eight times the square of the middle diameter;  $40 \times 40 \times 3 = 1600 \times 3 = 4800$ , three times the square of the end diameter; and  $50 \times 40 \times 4 = 2000 \times 4 = 8000$ , four times the product of the diameters; then  $(20000 + 4800 + 8000) \times 54 = 32800 \times 54 = 1771200$ ; and  $1771200 \div 4411.8 = 401.468$ , the content in wine gallons.

## EXAM. 51.

By Prob. XVII., Part V., we have  $54 \times 54 \times 32 = 2916 \times 32 = 93312$ , the square of the diameter of the top, multiplied by half the depth; then  $93312 \div 359.05 = 259.885$ , the content in ale gallons.

## EXAM. 52.

By the Remark at the end of Prob. XVII., Part V., we have  $30^2 + 42^2 = 900 + 1764 = 2664$ , the square of the radius of the top, added to the square of the middle diameter; then  $2664 \times 42 \times .5236 =$

M 2

$111888 \times .5236 = 58584.5568$ , the content in cubic inches ; and  $58584.5568 \div 231 = 253.6128$ , the content in wine gallons.

## EXAM. 53.

By Prob XVIII, Part V., we have  $72^2 + 48^2 \times 30 = (5184 + 2304) \times 30 = 7488 \times 30 = 224640$ , the sum of the squares of the diameters, multiplied by the depth ; and  $224640 \div 718.1 = 312.825$ , the content in ale gallons.

## EXAM. 54.

By the Remark at the end of Prob. XVIII., Part V., we have  $24^2 + 40^2 + 68^2 = 576 + 1600 + 4624 = 6800$ , the sum of the squares of the semi-diameters of the top and bottom, added to the square of the middle diameter ; then  $6800 \times 96 \times .5236 = 652800 \times .5236 = 341806.08$ , the content in cubic inches ; and  $341806.08 \div 231 = 1479.68$ , the content in wine gallons.

## EXAM. 55.

By Prob. XIX., Part V., we have  $42^2 + 45^2 = 1764 + 2025 = 3789$ , the sum of the squares of the top and bottom diameters ; and  $47^2 \times 4 = 2209 \times 4 = 8836$ , four times the square of the middle diameter ; then  $(3789 + 8836) \times 48 = 12625 \times 48 = 606000$  ; and  $606000 \div 2154.3 = 281.297$ , the content in ale gallons.

## EXAM. 56.

By Prob. XX., Part V., we have  $69^2 + 78^2 = 4761 + 6084 = 10845$ , the sum of the squares of the top and bottom diameters ;  $95^2 \times 2 = 9025 \times 2 = 18050$ , twice the square of the middle diameter ; and  $87^2 + 90^2 \times 4 = (7569 + 8100) \times 4 = 15669 \times 4 = 62676$ , four times the sum of the squares of the diameters taken at one-fourth, and at three-fourths

of the depth; then  $(10845 + 18050 + 62676) \times 80 = 91571 \times 80 = 7325680$ ; and  $7325680 \div 4308.6 = 1700.246$ , the content in ale or porter gallons.

## EXAM. 57.

By Rule II., Prob. XXI., Part V., we have the following Solution.

	Diameters.	Areas.
	Inches.	Wine gallons.
First	82.6.....	28.1972
Second	97.5.....	32.3212
Third	107.4.....	39.2181
Fourth	109.3.....	40.6180
Fifth	110.7.....	41.6652
Sixth	104.6.....	37.1999
Seventh	96.2.....	31.4650

Then,  $28.1972 + 31.4650 = 54.6622$ , the sum of the two extreme areas;  $(32.3212 + 40.6180 + 37.1999) \times 4 = 110.1391 \times 4 = 440.5564$ , four times the sum of all the even areas; and  $39.2181 + 41.6652 \times 2 = 80.8833 \times 2 = 161.7666$ , twice the sum of all the odd areas; also  $90 \div 6 = 15$ , the common distance of the sections; hence,  $(54.6622 + 440.5564 + 161.7666) \times \frac{15}{3} = 656.9852 \times 5 = 3284.926$ , the content in wine gallons.

## EXAM. 58.

By Prob. XXII., Part V., we have  $50 \times 50 = 2500$ , the square of the diameter of the base; and  $\frac{32 + 28}{2} = \frac{55}{2} = 27.5$ , half the sum of the greater and least depth of the liquor; then  $2500 \times 27.5 = 68750$ ; and  $68750 \div 359.05 = 191.477$ , the content in ale gallons.

## EXAM. 59.

By the question, the diameter of the vessel is 85, and the versed sine of the ungula's base, or less segment 36; consequently,  $85 - 36 = 49$ , the versed sine of the greater segment.

Now, by Theo. 12, Part III., the product of the two parts of the diameter, is equal of the square of half the chord: hence, we have  $2\sqrt{49 \times 36} = 2\sqrt{1764} = 42 \times 2 = 84$  inches, the chord of the ungula's base.

By Rule I, Prob. XV., Part IV., we have  $84 \times 36 \times \frac{1}{3} = 3024 \times \frac{1}{3} = \frac{6048}{3} = 2016$ , two-thirds of the product of the chord and versed sine of the ungula's base; and  $\frac{36^3}{34 \times 2} = \frac{46656}{168} = 277.714$ , the cube of the versed sine divided by twice the chord: then  $2016 + 277.714 = 2293.714$  square inches, the area of the ungula's base.

By Prob. XXIII., Part V., we have  $\frac{85}{2} - 36 = 42.5 - 36 = 6.5$ , the difference between half the diameter of the vessel, and the versed sine of the ungula's base; then  $2293.714 \times 6.5 = 14909.141$ , the area of the base multiplied by the said difference.

Again,  $42^3 \times \frac{1}{3} = 74088 \times \frac{1}{3} = \frac{148176}{3} = 49392$ , two-thirds of the cube of half the chord; and  $49392 - 14909.141 = 34482.859$ ; then  $34482.859 \times \frac{60}{36} = \frac{2068971.54}{36} = 57470.143$ , the content in cubic inches; hence  $57470.143 \div 231 = 248.788$ , the content of the ungula, in wine gallons.

## EXAM. 60.

By Prob. XXIV., Part V., we have  $\frac{60 \times 60 \times 50}{6}$   
 $= \frac{3600 \times 50}{6} = \frac{180000}{6} = 30000$ , the content in cubic  
 inches; and  $\frac{30000}{282} = 106.382$ , the content of the un-  
 gula, in ale gallons.

## EXAM. 61.

By Note II., Prob. XV., Part IV., we have  $\frac{30 \times 30}{36}$   
 $+ 36 = \frac{900}{36} + 36 = 25 + 36 = 61$  inches, the diameter  
 of the vessel; hence it appears that the base of the un-  
 gula is greater than a semi-circle. By Rule II., Prob.  
 XV., Part IV., we have  $\frac{36}{61} = .590 \frac{1}{2}$  the quotient of  
 the versed sine, divided by the diameter: and by  
 Note 2, we have  $1 - .590 \frac{1}{2} = .409 \frac{1}{2}$ . The *Area*  
*Seg.* answering to this remainder is .303025, then  
 $.785398 - .303025 = .482373$ , the area segment,  
 corresponding to  $.590 \frac{1}{2}$ ; hence  $.482373 \times 61^2 =$   
 $.482373 \times 3721 = 1794.909933$  square inches, the  
 area of the ungula's base.

By Prob. XXV., Part V., we have  $36 - \frac{61}{2} = 36 -$   
 $30.5 = 5.5$ , the difference between the versed sine of  
 the ungula's base, and half the diameter of the vessel;  
 then  $1794.909933 \times 5.5 = 9872.0046315$ , the area of  
 the ungula's base, multiplied by the said difference.

Again,  $30^3 \times \frac{2}{3} = 27000 \times \frac{2}{3} = \frac{54000}{3} = 18000$ ,  
 two-thirds of the cube of half the chord; and  $9872 +$

$$\begin{aligned}
 18000 &= 27872; \text{ then } 27872 \times \frac{50}{36} = \frac{1393600}{36} \\
 &= 38711.111, \text{ the content in cubic inches; and } \frac{38711.111}{231} \\
 &= 167.580, \text{ the content of the ungula in wine gallons.}
 \end{aligned}$$

## EXAM. 62.

By Rule II., Prob. XV., Part IV., we have  $40 \div 50 = .8$ , the versed sine or depth of the liquor, divided by the diameter of the vessel. The *Area Seg.* answering to this quotient, is .673575; then  $.673575 \times 50^2 = .673575 \times 2500 = 1683.9375$  square inches, the area of the circular segment of the end; and by the Remark at the end of Prob. XXV., Part V., we have  $1683.9375 \times 60 = 101036.25$ , the content of the ungula in cubic inches; consequently,  $101036.25 \div 282 = 358.284$ , the content in gallons.

## EXAM. 63.

By the Solution to the last Examples, we have the area of the greater end  $= 1683.9375$  square inches; and as the less end is a semi-circle, we have  $(.7854 \times 2500) \div 2 = 1963.5 \div 2 = 981.75$ , its area in square inches.

Now  $\frac{40 + 25}{2} = \frac{65}{2} = 32.5$  inches, the depth of the liquor, at the middle of the vessel; then  $32.5 \div 50 = .65$ , the versed sine or depth of the liquor divided by the diameter of the vessel. The *Area Seg.* corresponding to this quotient, is .540418; then  $.540418 \times 2500 = 1351.045$  square inches, the area of the middle section.

By Prob. IX., Part V., we have  $1683.9375 + 981.75 = 2665.6875$ , the sum of the areas of the two ends; and  $1351.045 \times 4 = 5404.18$ , four times the area of the middle section; then  $(2665.6875 + 5404.18) \times \frac{60}{6}$

$= 8069.8675 \times 10 = 80698.675$ , the content of the ungula in cubic inches; and  $80698.675 \div 231 = 349.344$ , the content in wine gallons. (See the Remark at the end of Prob. XXV., Part V.)

## EXAM. 64.

By Prob. XXVI., Part V., we have  $87 \times 2 + 57 = 174 + 57 = 231$ , twice the length of the base, added to the length of the upper edge of the liquor; then,  $\frac{231 \times 68 \times 63}{6} = \frac{989604}{6} = 164934$ , the content of the ungula, in cubic inches; and  $164934 \div 282 = 584.872$ , the content in ale gallons.

## EXAM. 65.

By the question  $AB = 60$ ,  $CD = 50$ ,  $Dm = 40$ ,  $En = 30$ , and  $Am = \frac{60 - 50}{2} = \frac{10}{2} = 5$  inches;

then by Theo. 11, Part III., as  $40 : 5 :: 30 : 3.75$   $Am = An$ ; and  $60 - 3.75 \times 2$

$= 60 - 7.5 = 52.5 = EF$ , the diameter at the upper extremity of the liquor. Also, by Prob I., Part I.,  $\sqrt{52.5 \times 60} = \sqrt{3150} = 56.12$ , the mean proportional between the diameters  $AB$  and  $EF$ .

By Prob. XXVII., Part V., we have  $3150 \times 56.12 = 176778$ , the product of the two diameters multiplied by the mean proportional between them.

Also,  $60^3 = 216000$ , the cube of the bottom diameter; then  $\frac{216000 - 176778}{60 - 52.5} = \frac{39222}{7.5} = 5229.6$ ; and  $5229.6 \times 30 \times .001133 = 177.754104$ , the content of the ungula  $A B E$ , in wine gallons.

EXAM. 66.

By the question  $AB = 60$ ,  $CD = 50$ ,  $Dm = 40$ ,  $Dp = Em = 20$ , and  $Am = \frac{60^2 - 50^2}{20} = \frac{10}{2} = 5$  inches; then by Thm. 11, Part III, as  $40 : 5 :: 20 : 2.5 = An$ ; and  $60 - 2.5 \times 2 = 60 - 5 = 55 = EF$ , the diameter at the upper extremity of the liquor, when the vessel is in its first position. Also by Prob. I., Part I.,  $\sqrt{50 \times 55} = \sqrt{2750} = 52.44$ , the mean proportional between the diameters  $CD$  and  $EF$ .

By Prob. XXVIII, Part V., we have  $2750 \times 52.44 = 144210$ , the product of the two diameters multiplied by the mean proportional between them.

Also  $50^3 = 125000$ , the cube of the bottom diameter: then  $\frac{144210 - 125000}{55 - 50} = \frac{19210}{5} = 3842$ ; and  $3842 \times 30 \times .0009283 = 71.330572$ , the content of the ungula DCF, in ale gallons.

Again, by the same Prob. we have  $\sqrt{60 \times 50} = \sqrt{3000} = 54.77$ , the mean proportional between the diameters  $AB$  and  $CD$ ; and  $54.77 \times 3000 = 164310$ , the mean proportional multiplied by the product of the two diameters; then  $\frac{164310 - 125000}{60 - 50} = \frac{39310}{10} = 3931$ ; and  $3931 \times 40 \times .0009283 = 145.965892$ , the content of the ungula DCB, in ale gallons; then  $145.965892 - 71.330572 = 74.63532$  ale gallons, the answer required.

## EXAM. 67.

By the question  $AB = 70$ ,  $CD = 60$ , and  $Cm = 50$  inches. Now, as the ungula  $ABC$  is occupied by the liquor, when the vessel is in its first position, it is evident

that the content of the dry hoof  $ACD$ , will be the answer required.

By Prob. XXVIII., Part V., we have  $\sqrt{70 \times 60} = \sqrt{4200} = 64.807$ , the mean proportional between the diameters; and  $64.807 \times 4200 = 272189.4$ , the mean proportional multiplied by the product of the two diameters.

Also,  $60^3 = 216000$ , the cube of the diameter  $CD$ ; then  $\frac{272189.4 - 216000}{70 - 60} = \frac{56189.4}{10} = 5618.94$ ; and  $5618.94 \times 50 \times .0009283 = 260.8031001$  ale gallons, the content of the dry hoof  $ACD$ .

## EXAM. 68.

By Prob. XXX., Part V., we have  $90 - 75 = 15$ , the difference of the diameters; and  $\frac{60 - 15}{75} = \frac{45}{75} =$

the quotient obtained by subtracting the difference of the diameters from the versed sine of the base, and dividing the remainder by the less diameter. The *area Seg.* answering to this quotient is .492029.

Now,  $75^3 = 421875$ , the cube of the less diameter;

so,  $\frac{60}{60 - 15} = \frac{60}{45} = 1.333$ , the quotient arising from dividing the versed sine of the base by the difference between the said versed sine and the difference of the diameters; and  $\sqrt{1.333} = 1.154$ , the square

root of the said quotient; then  $.492029 \times 421875 \times 1.333 \times 1.154 = 207574.734375 \times 1.333 \times 1.154 = 276697.120921875 \times 1.154 = 319308.477543$ , the reserved product.

Again,  $90^3 = 729000$ , the cube of the bottom diameter; and  $\frac{60}{90} = .666\bar{3}$ , the quotient of the versed sine of the base divided by the bottom diameter. The *Area Seg.* answering to this quotient, is  $.556226$ ; then  $.556226 \times 729000 = 405488.754$ , the product arising from multiplying the last *Area Seg.* by the cube of the bottom diameter.

Now,  $405488.754 - 319308.477543 = 86180.276457$ , the difference between the last product and the reserved product; also  $81 \div 3 = 27$ , one-third of the perpendicular height of the ungula; then  $86180.276457 \times \frac{27}{15} = 86180.276457 \times \frac{9}{5} = \frac{775622.488113}{5} = 155124.4976226$ , the content of the ungula, in cubic inches; and  $155124.497 \div 282 = 550.086$ , the content in ale gallons.

*Note.* In order to find the *Area Seg.* answering to  $.666\bar{3}$ , we have  $1 - .666\bar{3} = .333\bar{3}$ . The *Area Seg.* answering to  $.333$ , is  $.229801$ , and that answering to  $.333$ , is  $.228858$ ; their difference is  $.000943$ ; one-third of which is  $.000314$ . This being added to  $.228858$ , gives  $.229172$ , the *Area Seg.* corresponding to  $.333\bar{3}$ ; then  $.785398 - .229172 = .556226$ , the *Area Seg.* answering to  $.666\bar{3}$ . (See Notes under Rule II., Prob. XV., Part IV.)

### EXAM. 69.

By Prob. XXXI., Part V., we have  $\frac{55 - 40 + 16}{55} = \frac{15 + 18}{55} = \frac{33}{55} = .6$ ; the *Area Seg.* answering to this quotient is  $.492029$ ; and  $.492029 \times 55^3 = .492029 \times 166375 = 81861.824875$ , the first number.

Again,  $\frac{18}{15 + 18} = \frac{18}{33} = .545$ ; and  $\sqrt{.545^3} = \sqrt{.161878625} = .4023$ , the second number.

Again,  $\frac{18}{40} = .45$ ; the *Area Seg.* answering to this quotient, is .342782; and  $.342782 \times 40^3 = .342782 \times 64000 = 21938.048$ , the third number.

Again,  $\frac{21}{15 \times 3} = \frac{21}{45} = .4666$ , the fourth number.

Now,  $81861.324875 \times .4023 = 32932.8109972125$ , the product of the first and second numbers; then  $(32932.810997 - 21938.048) \times .4666 = 10994.762997 \times .4666 = 5130.1564144002$ , the content of the ungula in cubic inches; and  $5130.156 \div 282 = 18.192$ , the content in ale gallons.

## EXAM. 70.

By Prob. XXXII., Part V., we have  $50 - 37 = 13$ , the versed sine of the base of the ungula; and  $\frac{13}{50} = .26$ . The *Area Seg.* answering to this quotient, is .162263; then  $.162263 \times 50^3 = .162263 \times 2500 = 405.6575$ , the area of the ungula's base; and  $405.6575 \times \frac{50}{13} = \frac{20282.875}{13} = 1560.221$ , the reserved quotient.

Again,  $\sqrt{13 \times 37 \times 37} \times \frac{4}{3} = \sqrt{481} \times \frac{148}{3} = 21.93 \times \frac{148}{3} = \frac{3245.64}{3} = 1081.88$ .

Then,  $(1560.221 - 1081.88) \times \frac{17.4}{3} = 478.341 \times 5.8 = 2774.3778$ , the content of the ungula, in cubic inches; and  $2774.3778 \div 231 = 12.0102$ , the content in wine gallons.

## EXAM. 71.

By Prob. XIV., Part V., we have  $32 \times 32 \times 2 = 1024 \times 2 = 2048$ , twice the square of the bung diameter; and  $26 \times 26 = 676$ , the square of the head

diameter ; then  $(2048 + 676) \times 45 = 2724 \times 45 = 122580$  ; and  $122580 \div 1077.15 = 113.800$  ; the content in ale gallons ; also,  $122580 \div 882.36 = 138.922$ , the content in wine gallons.

## EXAM. 72.

By Prob. XVI., Part V., we have  $32 \times 32 \times 8 = 1024 \times 8 = 8192$ , eight times the square of the bung diameter ;  $26 \times 26 \times 3 = 676 \times 3 = 2028$ , three times the square of the head diameter ; and  $32 \times 26 \times 4 = 832 \times 4 = 3328$ , four times the product of the diameters ; then  $(8192 + 2028 + 3328) \times 45 = 13548 \times 45 = 609660$  ; and  $609660 \div 5385.75 = 113.198$ , the content in ale gallons ; also  $609660 \div 4411.8 = 138.187$ , the content in wine gallons.

## EXAM. 73.

By Prob. XVIII., Part V., we have  $32 \times 32 = 1024$ , the square of the bung diameter ;  $26 \times 26 = 676$ , the square of the head diameter ; and  $(1024 + 676) \times 45 = 1700 \times 45 = 76500$ , the sum of the squares of the two diameters, multiplied by the length ; then  $76500 \div 718.1 = 106.530$ , the content in ale gallons ; and  $76500 \div 588.24 = 130.048$ , the content in wine gallons.

## EXAM. 74.

By Rule I., Prob. VIII., Part V., we have  $32 \times 26 \times 3 = 832 \times 3 = 2496$ , three times the product of the bung and head diameters ; and  $32 - 26)^2 = 6^2 = 36$ , the square of their difference ; then  $(2496 + 36) \times 45 = 2532 \times 45 = 113940$  ; and  $113940 \div 1077.15 = 105.779$ , the content in ale gallons ; also  $113940 \div 882.36 = 129.130$ , the content in wine gallons.

## EXAM. 75.

By Prob. X., Part IV., the square of the side of any regular polygon, multiplied by its proper factor, will give the area in square inches ; consequently, if the area of any polygon be divided by its proper factor, the quotient will be the square of the side ; hence

we have  $282 \times 45 \div .433013 = 12690 \div .433013 = 29306.279488$ , the square of the side; and  $\sqrt{29306.279488} = 171.190$  inches, the side required.

## EXAM. 76.

Let the triangle ABC represent the base of the prismatic vessel; and the circle ABC that of the cylindrical vessel; D being the centre of the triangle, and also that of its circumscribing circle; and  $AD = DB$ , the radius of the said circle.

Now, by Prob. X., Part IV., we have  $.433013 \times 50^2 = .433013 \times 2500 = 1082.5325$  square inches, the area of the triangle ABC; and  $\frac{1082.5325}{3} = 360.844$ , the area of the triangle ABD; and this area divided by half the base AB, will give the perpendicular Dm; that is  $360.844 \div 25 = 14.433$  inches = Dm.

By Prob. IV., Part I., we have  $Am^2 + Dm^2 = 25^2 + 14.433^2 = 625 + 208.311489 = 833.311489$ , the square of the radius AD; and  $833.311489 \times 3.1416 = 2617.9313738424$  square inches, the area of the circle ABC.

Now,  $1082.5325 \times 40 = 43301.3$  cubic inches, the content of the prismatic vessel; and  $2617.93137 \times 40 = 104717.2548$  cubic inches, the content of the cylindrical vessel; then  $104717.2548 - 43301.3 = 61415.9548$ , the difference of their contents; and  $61415.9548 \div 282 = 217.787$  ale gallons, the answer required.

*Note.* Here it may be proper to observe that no attention has been paid to the thickness of the sides of the prismatic vessel.

## EXAM. 77.

By Prob. II., Part IV., the length of a rectangle, multiplied by its breadth, will give the area; consequently, if the area of a rectangle be divided by one of its dimensions, the quotient will be the other dimension; hence we have  $282 \times 12 \div 60 = 3384 \div 60 = 56.4$  inches; and  $80 - 56.4 = 23.6$  inches; therefore, the length of each vessel is 60 inches; the breadth of the greater 56.4 inches, and that of the less 23.6 inches.

## EXAM. 78.

By Prob. II., Part V., it is evident that if we divide the content of a parallelopipedon by one of its dimensions, the quotient will be the product of the other two dimensions; hence, we have  $282 \times 380 = 107160$  cubic inches, the content of the less cistern; and  $107160 \div 48 = 2232.5$  the area of the base; then by Prob. II., Part IV., we have  $2232.5 \div 64 = 34.882$ ; and  $86 - 34.882 = 51.118$ ; consequently, the length of each cistern is 64 inches; the breadth of the greater 51.118 inches, and that of the less 34.882 inches.

## EXAM. 79.

Let A B C denote the triangular cooler; then by the question,  $AC = 60$ ,  $BC = 70$ , and  $AB = 80$  inches.

By Prob. V., Part IV., we have  $\frac{60 + 70 + 80}{2} = \frac{210}{2} = 105$ , half the sum of the three sides; then  $105 - 60 = 45$ , the first remainder;  $105 - 70 = 35$ , the

second remainder; and  $105 - 80 = 25$ , the third remainder; then  $\sqrt{105 \times 45 \times 35 \times 25} = \sqrt{4134375} = 2033.316$  square inches, the area of the triangle ABC.

Now,  $282 \times 3 = 846$  square inches, the area of the trapezoid ABED; the line DE being the dividing plane; and  $2033.316 - 846 = 1187.316$  square inches, the area of the triangle DEC.

Then by Theo. 13, Part III., as the area of the triangle ABC is to the square of any of the sides, so is the area of the triangle DEC, to the square of any similar side; hence, as  $2033.316 : 60^2 :: 1187.316 : 2102.151165 = DC^2$ ; and  $\sqrt{2102.151165} = 45.849$  inches  $= DC$ .

Again, as  $2033.316 : 70^2 :: 1187.316 : 2861.261309 = EC^2$ ; and  $\sqrt{2861.261309} = 53.490$  inches,  $= EC$ .

Lastly, as  $2033.316 : 80^2 :: 1187.316 : 3737.157628 = DE^2$ ; and  $\sqrt{3737.157628} = 61.132$  inches  $= DE$ ; hence all the sides of the triangle DEC are determined.

## EXAM. 80.

Let ABC represent the triangular cooler; and CD the dividing plane; then by the question,  $AC = 60$ ,  $BC = 70$ ,  $AB = 80$ , and  $AD = DB = 40$  inches.

By Theo. 14, Part III., we have  $\frac{AC^2 + BC^2 - 2AD^2}{2}$   
 $= CD^2$ : that is  $\frac{3600 + 4900 - 3200}{2} =$

$$\frac{8500 - 3200}{2} = \frac{5300}{2} = 2650 = CD^2; \text{ and } \sqrt{2650} \\ = 51.478 \text{ inches} = CD.$$

By Prob. V., Part IV., we have  $\frac{60 + 40 + 51.478}{2}$   
 $= \frac{151.478}{2} = 75.739$ , half the sum of the three sides;  
 then  $75.739 - 60 = 15.739$ , the first remainder;  
 $75.739 - 40 = 35.739$ , the second remainder; and  
 $75.739 - 51.478 = 24.261$ , the third remainder; and  
 by multiplying the half sum and the three remainders  
 continually together, we obtain 1033588.804259, the  
 square root of which is 1016.655, the area of the  
 triangle ADC in square inches; hence  $1016.655 \div$   
 $282 = 3.605$ , the area in ale gallons.

Now, by the solution to the last example, the area  
 of the triangle ABC is 2033.316 square inches; con-  
 sequently,  $2033.316 - 1016.655 = 1016.661$  square  
 inches, the area of the triangle BCD; and  $1016.661 \div$   
 $282 = 3.605$ , the area in ale gallons; hence it appears  
 that the line DC divides the triangle ABC into two  
 equal parts.

*Note.* By Theo. 6, Part III., triangles upon the same base, (or  
 of equal bases,) and between the same parallels are equal; hence  
 the last question might have been solved on this principle, by  
 dividing the area of the given triangle by two.

#### EXAM. 81.

Here  $16 \times 8 \times 2150.42 = 128 \times 2150.42 =$   
 $275253.76$  cubic inches, the content of the cistern,  
 whose depth is required; then by the Note under  
 Prob. II., Part V., we have  $\frac{275253.76}{94 \times 72} = \frac{275253.76}{6768} =$   
 $40.669$  inches, the depth required.

## EXAM. 82.

By Prob. V., Part I., we have  $\sqrt{180^2 - 108^2} = \sqrt{32400 - 11664} = \sqrt{20736} = 144$  inches, the length of the cistern.

Now, by Prob. II., Part V., we have  $144 \times 108 \times 42 = 15552 \times 42 = 653184$ , the content in cubic inches; and  $653184 \div 5 = 130636.8$  cubic inches, the allowance for the swell of the grain; then  $\frac{653184 - 130636.8}{2150.42} = \frac{522547.2}{2150.42} = 242.997$  bushels, the answer required.

## EXAM. 83.

Here  $9743 \times 282 = 2747526$ , the content in cubic inches; and by Note 1, Prob. IV., Part V., we have  $147 \times 147 \times .7854 = 21609 \times .7854 = 16971.7086$ , the area of the base; then by Note 2, of the same Prob. we have  $2747526 \div 16971.7086 = 161.888$  inches, the depth required.

## EXAM. 84.

By Prob. IV., Part I., we have  $\sqrt{36^2 + 36^2} = \sqrt{1296 + 1296} = \sqrt{2592}$  = the side of the given vessel; then by Prob. I., Part V., we have  $\sqrt{2592} \times \sqrt{2592} \times \sqrt{2592} = \sqrt{2592 \times 2592 \times 2592} = \sqrt{17414258688} = 131963.095$ , the content in cubic inches; and  $131963.095 \div 231 = 571.268$ , the content in wine gallons.

## EXAM. 85.

By Note 1, Prob. IV., Part V., we have  $18.5 \times 18.5 \times 7854 \times 8 = 342.25 \times .7854 \times 8 = 268.803.15 \times 8 = 2150.4252$ , the content of the Winchester bushel, in cubic inches; and  $2150.4252 \div 9 = 238.93613$  square inches, the area of the base of the bushel,

whose depth is 9 inches; then  $\sqrt{238.93613 \div .7854} = \sqrt{304.22222} = 17.441$  inches, the diameter required.

## EXAM. 86.

Let ABCD represent the middle perpendicular section of the given vessel; then by the question,  $AB = 150$ ,  $CD = 86$ , and  $BC = 68$  inches; consequently

$$Bm = \frac{150 - 86}{2} =$$

$$\frac{64}{2} = 32 \text{ inches.}$$

By Prob. V., Part I., or Theo. 7, Part III., we have  $\sqrt{68^2 - 32^2} = \sqrt{4624 - 1024} = \sqrt{3600} = 60$  inches, the perpendicular height  $Cm$ .

By Rule II., Prob. VIII., Part V., we have  $\overline{150 + 86}^2 = 236^2 = 55696$ , the square of the sum of the diameters; and  $150 \times 86 = 12900$ , the product of the diameters; then  $(55696 - 12900) \times 60 = 42796 \times 60 = 2567760$ ; and  $2567760 \div 1077.15 = 2383.846$ , the content in ale gallons.

## EXAM. 87.

(See the last Figure.)

Let ABCD represent the middle perpendicular section of the vessel; then by the question,  $AB = 195$ ,  $BC = 85$ , and  $Cm = 75$ ; then by Prob. V., Part I., we have  $Bm = \sqrt{85^2 - 75^2} = \sqrt{7225 - 5625} = \sqrt{1600} = 40$  inches, half the difference between the sides; hence  $195 - 40 \times 2 = 195 - 80 = 115 = CD$ , the side of the top of the given vessel.

By Rule II., Prob. VI., Part V., we have  $195 \times 195 = 38025$ , the square of the side of the base;  $115 \times 115 = 13225$ , the square of the side of the top; and  $195 \times 115 = 22425$ , the product of the sides; then  $(38025 + 13225 + 22425) \times 75 \div 3 = 73675 \times 25 = 1841875$ , the content in cubic inches. Hence  $1841875 \times .000465 = 856.471875$ , the content in malt bushels.

## EXAM. 88.

Here  $3834 \times 231 = 885654$ , the content in cubic inches; and by Prob. X., Part IV., we have  $74 \times 74 \times 1.720477 = 5476 \times 1.720477 = 9421.332052$  square inches, the area of the base; then by Note 3, Prob. III., Part V., we have  $885654 \div 9421.332052 = 94.005$  inches, the depth required.

## EXAM. 89.

By Prob. II., Part V., we have  $182 \times 112 \times 74 = 20384 \times 74 = 1508416$ , the content of the reservoir in cubic inches; and  $26 \times 3 = 78$  pints  $= 2749.5$  cubic inches; the quantity of water, which the reservoir receives in one minute; then  $\frac{1508416}{2749.5} = 548.614$  minutes  $= 9$  hours, 8.614 minutes, the time required.

## EXAM. 90.

Let ABCD represent the middle section of the given vessel; then by the question,  $AB = 86$ ,  $CD = 62$ ,  $Cm = 58$ ,  $Fm = 40$ ; and  $Bm = \frac{86 - 62}{2} = \frac{24}{2} = 12$  inches.

By Theo. 11, Part III., the triangle  $BnF$  is similar to the triangle  $BmC$ ; hence, as  $Cm : Bm :: Fn : Bn$ ; that is, as  $58 : 12 :: 40 : 8.275 = Bn$ ; then  $AB - 2 Bn = 86 - 16.55 = 69.45$  inches  $= EF$ , the diameter at the surface of the liquor.

By Rule I., Prob. VIII., Part V., we have  $69.45 \times 86 \times 3 = 5972.7 \times 3 = 17918.1$ , three times the product of the top and bottom diameters; and  $86 - 69.45 = 16.55^2 = 273.9025$ , the square of their difference; then  $(17918.1 + 273.9025) \times 40 = 18192.0025 \times 40 = 727680.1$ ; and  $727680.1 \div 1077.15 = 675.560$ , the content in ale gallons.

### EXAM. 91.

(See the last Figure.)

Let  $ABCD$  represent the middle section of the given vessel; then by the question,  $AB = 94$ ,  $CD = 68$ ,  $Cm = 65$ ;  $Fn = 45$ , and  $Bm = \frac{94 - 68}{2} = \frac{26}{2} = 13$  inches.

By Theo. 11, Part III., the triangle  $BnF$  is similar to the triangle  $BmC$ ; hence, as  $Cm : Bm :: Fn : Bn$ ; that is, as  $65 : 13 :: 45 : 9 = Bn$ ; then  $AB - 2 Bn = 94 - 18 = 76$  inches  $= EF$ , the side of the vessel, at the surface of the liquor.

By Rule II., Prob. VI., Part V., we have  $94 \times 94 = 8836$ , the square of a side of the base;  $76 \times 76 = 5776$ , the square of the side at the surface of the liquor; and  $94 \times 76 = 7144$ , the product of the sides; then  $(8836 + 5776 + 7144) \times 45 \div 3 = 21756 \times 15 = 326340$ , the content in cubic inches; hence  $326340 \times .004329 = 1412.725$ , the content in wine gallons.

## EXAM. 92.

Let ABCD represent the middle, perpendicular section, made through the transverse diameters of the given vessel; then by the question,  $AB = 86$ ,  $CD = 62$ ,  $Cm = 65$ ,  $Fn = 42$ , and  $Bm = \frac{86 - 62}{2}$   
 $= \frac{24}{2} = 12$  inches.

By Theo. 11, Part III., the triangle  $BnF$  is similar to the triangle  $BmC$ ; hence, as  $Cm : Bm :: Fn : Bn$ ; that is, as  $65 : 12 :: 42 : 7.753 = Bn$ ; then  $AB - 2 Bn = 86 - 15.506 = 70.494$  inches  $= EF$ , the transverse diameter at the surface of the liquor:

Again, let ABCD represent the middle perpendicular section, made through the conjugate diameters of the given vessel; then by the question,  $AB = 58$ ,  $CD = 42$ ,  $Cm = 65$ ,  $Fn = 42$ , and  $Bm = \frac{58 - 42}{2}$   
 $= \frac{16}{2} = 8$  inches.

By similar triangles, as  $65 : 8 :: 42 : 5.169 = Bn$ ; and  $AB - 2 Bn = 58 - 10.338 = 47.662$  inches  $= EF$ , the conjugate diameter at the surface of the liquor.

By Prob. IX., Part V., we have  $\frac{86 + 70.494}{2} =$   
 $\frac{6.494}{2} = 78.247$ , the transverse diameter of the

THE CONTENT:  $\text{AND } \frac{25 - 47.502}{2} = \frac{105.002}{2} =$   
 52.501 THE CONTENT OF THE WHOLE SECTION.

THE AREA OF THE BASE  $= 4098 \times 7.854 = 32075.532$   
 THE AREA OF THE MIDDLE SECTION  $= 22331 \times 7.854 =$   
 $175387.494$  THE AREA OF THE TOP SECTION  $= 32321 \times 7.854 =$   
 $253855.374$  THREE TIMES THE AREA OF THE  
 MIDDLE SECTION  $\text{AND } 22331 \times 47.502 \times 7.854 =$   
 $8283357.10012$ , THE AREA OF  
 THE WHOLE SECTION.

THE CONTENT  $= 253855.374 \div 252 = 1007.3626$  X  
 $\frac{1}{2} = 503.6813$  THE CONTENT  $=$   
 $1007.3626 \div 252 = 485.12318$   
 THE CONTENT IS 485.12318

### PROBLEM.

THE CONTENT OF A FRUSTUM OF THE FRUSTUM OF A  
 CYLINDER MAY NOW EASILY BE OBTAINED BY THE FOLLOWING  
 RULE: ADD THE SUM OF THE PRODUCT OF THE  
 DIAMETERS OF THE BASE, THE PRODUCT OF THE DIAMETERS OF  
 THE TOP, AND THREE TIMES THE PRODUCT OF THE DIAMETERS OF  
 THE MIDDLE SECTION. MULTIPLY THIS SUM BY THE PER-  
 PENDICULAR HEIGHT, AND THE PRODUCT BY 2154.3.  
 THE QUOTIENTS WILL BE THE CONTENT IN AIR AND WINE GALLONS, AND MUST  
 BE MULTIPLIED BY 1.056786 FOR THE CONTENT IN ALE GALLONS.

*Illustration of the last Example by this Rule.*

THE CONTENT  $= (4098 + 22331 + 32321) \times$   
 $7.854 \times 42 = 1045100.870352$ ; AND  
 $1045100.870352 \div 2154.3 = 485.12318$ , THE CONTENT  
 IS 485.12318

### EXAM. 93.

BY RULE I., PROB. VII., PART V., WE HAVE  $64 \times 64 \times$   
 $25 = 1024 \times 25 = 115764$ , THE SQUARE OF THE DIAMETER

of the base multiplied by one-third of the altitude ; and  $118784 \div 359.05 = 330.828$ , the content of the given vessel, in ale gallons.

Then by Proportion, as  $3 : 2 :: 330.828 : 220.552$ , the content of the frustum ; and as  $3 : 1 :: 330.828 : 110.276$ , the content of the segment, in ale gallons.

#### EXAM. 94.

By Rule II., Prob VI., Part V., we have  $60 \times 60 = 3600$ , the square of the side of the base ;  $40 \times 40 = 1600$ , the square of the side of the top ; and  $60 \times 40 = 2400$ , the product of the sides ; then  $(3600 + 1600 + 2400) \times \frac{84}{3} = 7600 \times 28 = 212800$ , the content in cubic inches ; hence  $212800 \times .004329 = 921.2112$ , the content in wine gallons.

Then by Proportion, as  $9 : 5 :: 921.2112 : 511.784$ , the content of the greater vessel ; and as  $9 : 4 :: 921.2112 : 409.4272$ , the content of the less vessel, in wine gallons.

#### EXAM. 95.

By the question,  $AB = 60$ , and  $CF = 72$  ; then by Note 1, Prob. VII., Part V., we have  $60 \times 60 \times .7854 = 2827.44$ , the area of the base in square inches ; and  $2827.44 \times 24 = 67858.56$ , the content of the cone ABC, in cubic inches ; so,  $67858.56 \div 2 = 33929.28 =$  content of the segment or cone EC.

Now, by similar solids, Theo. 20, Part III., as  $358.56 : 60^3 :: 33929.28 : 108000 = DE^3$  ; and  $\sqrt[3]{108000} = 47.622$  inches  $= DE$ , the diameter of

the top of the frustum, and also that of the base of the segment.

Again, as  $67858.56 : 72^3 :: 33929.28 : 186624 = CG^3$ ; and  $\sqrt[3]{186624} = 57.146$  inches  $= CG$ , the altitude of the segment; and  $72 - 57.146 = 14.854$  inches  $= FG$ , the altitude of the frustum.

### EXAM. 96.

Let ABCD represent the given vessel; and AFB, the pyramid when completed; then by the question  $AB = 60$ ,  $CD = 40$ ,  $DH = 50$ ,  $AG = 30$ , and  $AH = 10$  inches.

Now, by similar triangles, Theo. 11, Part III., as  $AH : HD :: AG : GF$ ; that is, as  $10 : 50 :: 30 : 150 = GF$ ; and  $150 - 50 = 100$  inches  $= EF$ .

By Prob. V., Part V., we have  $40 \times 40 \times \frac{100}{3} = 1600 \times \frac{100}{3} = \frac{160000}{3}$ , the content of the pyramid DFC.

Also, by Rule II., Prob. VI., Part V., we have  $(60 \times 60 + 40 \times 40 + 60 \times 40) \times \frac{50}{3} = \frac{380000}{3} =$  the content of the given vessel ABCD; and this being divided by 2, we obtain  $\frac{190000}{3}$ , the content of the frustum KLCD; the line KL being the dividing plane; then  $\frac{160000}{3} + \frac{190000}{3} = \frac{350000}{3}$ , the content of the pyramid KFL.

Now, by similar solids, Theo. 20, Part III., as  $\frac{160000}{3} : 40^3 :: \frac{350000}{3} : 140000 = KL^3$ ; and

$\sqrt[3]{140000} = 51.924$  inches  $= KL$ , the top diameter of the vessel ABLK, and the bottom diameter of the vessel KLCD.

Again, by similar solids, as  $\frac{160000}{3} : 100^3 :: \frac{350000}{3} : 2187500 = FM^3$ ; and  $\sqrt[3]{2187500} = 129.812 = FM$ ; then  $FM - FE = 129.812 - 100 = 29.812$  inches  $= EM$ , the altitude of the vessel KLCD; and  $DH - EM = 50 - 29.812 = 20.188$  inches  $= MG$ , the altitude of the vessel ABLK.

## EXAM. 97.

Let ABCD denote the given spherical vessel; then by the question  $BD = 74$ ,  $BE = 25$ , and  $ED = 74 - 25 = 49$  inches.

Now, by Theo. 9, Part III., the angle BAD, in the semi-circle, is a right angle; and by Theo 12,  $BE \times ED = AE^2$ ; that is,  $49 \times 25 = 1225 =$  the square of the radius AE.

By Rule II., Prob. X., Part V., we have  $(74 \times 74 \times 74) \div 538.58 = 5476 \times 74 \div 538.58 = 405224 \div 538.58 = 752.893$  ale gallons, the content of the given vessel ABCD.

By Rule I., Prob. XI., Part V., we have  $1225 \times 3 = 3675$ , three times the square of the radius AE; and  $25 \times 25 = 625$ , the square of the depth BE; then  $(3675 + 625) \times 25 \times .5236 = 4300 \times 25 \times .5236 = 107500 \times .5236 = 56287$ , the content in cubic inches; hence  $56287 \div 282 = 199.599$  ale gallons, the content of the less segment ABC; consequently,  $752.393 - 199.599 = 552.794$  ale gallons, the content of the greater segment ADC.

## EXAM. 98.

Let ABC represent the given semi-spheroidal vessel; then by the question,  $AB = 50$ ,  $FC = 60$ , and  $FG = 30$ ; the line DE being the dividing plane.

By the Note at the end of Prob. XIII., Part V., we have  $60 + 30 = 90$ , the altitude of the given vessel ABC, added to that of the frustum ABED;  $60 - 30 = 30$ , the difference between their altitudes; and  $2 \sqrt{90 \times 30} = 2 \sqrt{2700} = 51.9615 \times 2 = 103.923$ , twice the square root of the product of the sum and difference.

Then, as  $120 : 50 :: 103.923 : 43.30125$  inches, the diameter DE.

Now, by the Remark at the end of Prob. XIII., Part V., we have  $50 \times 50 \times 60 = 2500 \times 60 = 150000$ , the square of the diameter AB, multiplied by the perpendicular FC; then  $150000 \div 441.18 =$

339.997 wine gallons, the content of the given vessel ABC.

Again, by the Remark at the end of Prob. XIV., Part V., we have  $2500 \times 2 + 43.30125^2 = 5000 + 1874.9982515625 = 6874.9982515625$ , twice the square of the diameter AB, added to the square of the diameter DE; then  $6874.99825 \times 30 \div 882.36 = 206249.9475 \div 882.36 = 233.748$  wine gallons, the content of the frustum ABED; and  $389.997 - 233.748 = 106.249$  wine gallons, the content of the segment DEC.

## EXAM. 99.

Let ABC represent the given parabolic vessel; then by the question,  $AB = 50$ ,  $FC = 60$ , and  $FG = 30$ ; the line DE being the dividing plane.

By Note 4, Prob. XVII., Part V., we have  $60 - 30 = 30$ , the reserved remainder; then, as  $60 : 50^2 :: 30 : 1250$ , the square of the diameter DE.

By Prob XVII., Part V., we have  $50 \times 50 \times 30 = 2500 \times 30 = 75000$ , the square of the diameter AB, multiplied by half the altitude FC; and  $75000 \div 294.12 = 254.997$  wine gallons, the content of the given vessel ABC.

Again, by Prob. XVIII., Part V., we have  $(2500 + 1250) \times 30 = 3750 \times 30 = 112500$ , the sum of the squares of AB and DE multiplied by FG; and  $112500 \div 588.24 = 191.248$  wine gallons, the content of the frustum ABED; and  $254.997 - 191.248$

= 63.749 wine gallons, the content of the segment DEC.

EXAM. 100.

By Prob. XVIII., Part V., we have  $(300^2 + 312^2) \times 336 = (90000 + 97344) \times 336 = 187344 \times 336 = 62947584$ , the sum of the squares of the head and bung diameters multiplied by the height; then,  $62947584 \div 588.24 = 107010$  wine gallons, the content of this enormous cask.

**PART VI.**

*The Method of Gauging and Fixing Victuallers' Utensils; of Gauging and Inching Common Brewers' Utensils; and of Gauging and Ullaging Casks. Also, the Method of Gauging and Fixing Maltsters' Utensils; and of Gauging and Inching a Still, and a Distiller's Wash-Back. Likewise, the Method of Gauging and Fixing the Utensils of Soap-Makers, Starch-Makers, and Glass-Makers, as practised in the EXCISE.*

**SECTION I.**

**THE METHOD OF GAUGING AND FIXING VICTUALLERS' UTENSILS, AS PRACTISED IN THE EXCISE.**

### PROBLEM III.

*To gauge and fix a copper with a falling crown.*

EXAM. 3.

BY RULE II.

*To find the area.*

Here  $48.4 \times 48.4 \div 359.05 = 2342.56 \div 359.05 = 6.52$ , the area of the first section, in ale gallons;  $54.6 \times 54.6 \div 359.05 = 2981.16 \div 359.05 = 8.30$ , the area of the second section;  $57.6 \times 57.6 \div 359.05 = 3317.76 \div 359.05 = 9.24$ , the area of the third section;  $59.2 \times 59.2 \div 359.05 = 3504.64 \div 359.05 = 9.76$ , the area of the fourth section;  $56.8 \times 56.8 \div 359.05 = 3226.24 \div 359.05 = 8.98$ , the area of the fifth section; and  $54.4 \times 54.4 \div 359.05 = 2959.36 \div 359.05 = 8.24$ , the area of the sixth section.

## BY THE SLIDING RULE.

On A.	On B.	On A.	On B.
As 359.05 :	$\left\{ \begin{array}{l} 48.4 \\ 54.6 \\ 57.6 \\ 59.2 \\ 56.8 \\ 54.4 \end{array} \right\}$	$\left\{ \begin{array}{l} 48.4 \\ 54.6 \\ 57.6 \\ 59.2 \\ 56.8 \\ 54.4 \end{array} \right\}$	$\left\{ \begin{array}{l} 6.52 \text{ first section.} \\ 8.30 \text{ second section.} \\ 9.24 \text{ third section.} \\ 9.76 \text{ fourth section.} \\ 8.98 \text{ fifth section.} \\ 8.24 \text{ sixth section.} \end{array} \right\}$

Having found the areas of the different sections, both by the *Pen* and the *Sliding Rule*, in order to *prove* the work ; the dimensions and areas will appear in the Note Book, as below.

## NOTE BOOK.

<i>A. B.'s Copper, No. 2, gauged Jan. 23, 1821.</i>			
Divisions in Inches.	Depths from the Bottom.	Mean Diameters.	Areas.
8.4	34.2	54.4	8.24
6	27	56.8	8.98
6	21	59.2	9.76
6	15	57.6	9.24
6	9	54.6	8.30
6	3	48.4	6.52

*To find the content.*

Here  $6.52 \times 6 = 39.12$  ale gallons, the content of the first 6 inches from the bottom ;  $8.30 \times 6 = 49.80$ , the content of the second 6 inches ;  $9.24 \times 6 = 55.44$ , the content of third 6 inches ;  $9.76 \times 6 = 58.56$ , the content of the fourth 6 inches ;  $8.98 \times$

6 = 53.88, the content of the fifth 6 inches; and  $8.24 \times 8.4 = 69.216$ , the content of the last 8.4 inches of the depth; hence  $39.12 + 49.8 + 55.44 + 58.56 + 53.88 + 69.216 = 326.016$  ale gallons, the whole content of the copper.

### PROBLEM IV.

*To gauge and fix an under-back.*

EXAM. 2.

BY THE PEN.

Here  $38.6 \times 38.6 = 1489.96$ , the square of the mean diameter; and  $1489.96 \div 359.05 = 4.149$ , the area in ale gallons; then  $4.15 \times 32.4 = 134.46$ , the content in ale gallons.

BY THE SLIDING RULE.

*To find the area.*

	On A.	On B.	On A.	On B.

## PROBLEM XIV.

*Given the top and bottom diameters, and the perpendicular depth of a vessel in the form of the frustum of a cone, to determine the intermediate diameters, at any assigned depth.*

EXAM. 2.

Here  $\frac{58 - 42}{35} = \frac{16}{35} = .457$ , the common factor or multiplier; then  $58 - 5 \times .457 = 58 - 2.285 = 55.715$ , the diameter at 5 inches from the bottom;  $58 - 10 \times .457 = 58 - 4.570 = 53.430$ , the diameter at 10 inches from the bottom;  $58 - 15 \times .457 = 58 - 6.855 = 51.145$ , the diameter at 15 inches from the bottom;  $58 - 20 \times .457 = 58 - 9.140 = 48.860$ , the diameter at 20 inches from the bottom;  $58 - 25 \times .457 = 58 - 11.425 = 46.575$ , the diameter at 25 inches from the bottom; and  $58 - 30 \times .457 = 58 - 13.710 = 44.290$ , the diameter at 30 inches from the bottom.

## PROBLEM XV.

*Given the top and bottom diameters, and the perpendicular depth of a vessel in the form of the frustum of a semi-sphere, to determine the intermediate diameters, at any assigned depth from the top of the vessel.*

## EXAM. 2.

*To find the diameter of the sphere.*

By Rule I., we have  $\frac{18^2 - (12^2 + 8^2)}{8 \times 2} =$   
 $\frac{324 - (144 + 64)}{16} = \frac{324 - 208}{16} = \frac{116}{16} = 7.25$  inches,  
 the distance of the bottom diameter of the frustum, from the centre of the sphere.

Again,  $2 \sqrt{7.25^2 + 18^2} = 2 \sqrt{52.5625 + 324} =$   
 $2 \sqrt{376.5625} = 19.4 \times 2 = 38.8$  inches, the diameter of the sphere.

*To find the height of the segment.*

By Rule II., we have  $19.4 - (8 + 7.25) = 19.4 - 15.25 = 4.15$  inches, the height of the segment.

*To find the intermediate diameters.*

By Rule III., we have  $2 \sqrt{(38.8 - 5.15) \times 5.15}$   
 $2 \sqrt{33.65 \times 5.15} = 2 \sqrt{173.2975} = 13.16 \times 2 = 26.32$   
 inches, the diameter at 1 inch from the top of the given vessel.

Again,  $2 \sqrt{(38.8 - 6.15) \times 6.15} = 2 \sqrt{32.65 \times 6.15}$   
 $= 2 \sqrt{200.7975} = 14.17 \times 2 = 28.34$  inches, the diameter at 2 inches from the top of the vessel.

Again,  $2 \times \sqrt{38.8 - 7.15} \times 7.15 = 2 \times \sqrt{31.65} \times 7.15$   
 $= 2 \times 256.3875 = 15.04 \times 2 = 30.08$  inches, the diameter at  $\frac{1}{2}$  inches from the top of the vessel.

By a similar process, we find the diameter at four inches, to be 31.03; at five, 32.94; at six, 34.10; and at seven inches from the top of the vessel, the diameter is found to be 35.79 inches.

### EXAMPLE 3.

*To find the diameter of the sphere.*

By Rule I, we have  $\frac{27.8^2 - (14^2 + 12^2)}{12 \times 2} =$   
 $\frac{772.84 - (196 + 144)}{24} = \frac{772.84 - 340}{24} = \frac{432.84}{24} =$   
 18.03 inches, the distance of the bottom diameter of the frustum from the centre of the sphere.

Again,  $2 \times \sqrt{18.03^2 + 27.8^2} = 2 \times \sqrt{325.0809 + 772.84} = 2 \times \sqrt{1097.9209} = 33.13 \times 2 = 66.26$  inches, the diameter of the sphere.

*To find the height of the segment.*

By Rule II, we have  $33.13 - (18.03 + 12) = 33.13 - 30.03 = 3.1$  inches, the height of the segment.

*To find the intermediate diameters.*

By Rule III, we have  $2 \times \sqrt{(66.26 - 4.1) \times 4.1} = 2 \times \sqrt{62.16 \times 4.1} = 2 \times \sqrt{254.856} = 15.96 \times 2 = 31.92$  inches, the diameter at 1 inch from the top of the given vessel.

Again,  $2 \times \sqrt{(66.26 - 5.1) \times 5.1} = 2 \times \sqrt{61.16 \times 5.1} = 2 \times \sqrt{311.916} = 17.66 \times 2 = 35.32$  inches, the diameter at 2 inches from top.

Again,  $2 \sqrt{(66.26 - 6.1) \times 6.1} = 2 \sqrt{60.16 \times 6.1} = \sqrt{366.976} = 19.15 \times 2 = 38.30$  inches, the diameter at 3 inches from the top.

By a similar process we find the fourth intermediate diameter to be 40.98, the fifth 43.40, the sixth 45.60, the seventh 47.62, the eighth 49.48, the ninth 51.18, the tenth 52.76, and the eleventh 54.22 inches.

## SECTION II.

THE METHOD OF GAUGING AND INCHING COMMON BREWERS' UTENSILS, AS PRACTISED IN THE EXCISE.

PROBLEM III.

*To gauge and inch a Copper with a falling crown.*

EXAMPLE.

BY THE PEN.

*Find the content of the crown, considering it as the segment of a sphere.*

By Rule I., Prob. XI., Part V., we have  $29.2 \times 29.2 = 852.64 \times 3 = 2557.92$ , three times the square of the radius of the top; also  $8.2 \times 8.2 = 76.24$ , square of the depth; then  $(2557.92 + 76.24) \times 8.2 \div 236 = 2634.16 \times 8.2 \div 236 = 21600.112 \div 236 = 91.5259$ , the content in cubic inches; and  $91.5259 \div 2.2 = 41.6027$ , the content in ale gallons. (See the Dimension Book, in the Gauging.)

7	7	1	3	14	14	2	6	21	22	0	0

*To find the depth to be allowed for hops, false bottom, &c.*

**EXAMPLE.**

**SOLUTION BY THE PEN.**

Here  $114 \times 84 = 9576$  square inches, the area of the base of the hop-back ; and  $9576 \times 15.5 = 148428$  cubic inches, the content of the liquor, hops, and false bottom, in the hop-back.

Again,  $152 \times 126 = 19152$  square inches, the area of the base of the cooler ; and  $19152 \times 7 = 134064$  cubic inches, the content of the liquor when drawn off into the cooler.

Now,  $148428 - 134064 = 14364$  cubic inches, the content of the hops and false bottom ; then  $14364 \div 9576 = 1.5$  inches, the deduction that must be made in the depth, when a gauge of wort is taken in the hop-back.

## PROBLEM VIII.

*To gauge and inch a Guile Tun, in the form of a parallelopipedon.*

EXAMPLE.

## EXAM. 1.

BY THE PEN.

*To find the area of the sections.*

Here  $64.8 \times 54.2 \div 359.05 = 3512.16 \div 359.05 = 9.7818$ , the area of the first section;  $67.7 \times 56.6 \div 359.05 = 3845.96 \div 359.05 = 10.7098$ , the area of the second section;  $70.4 \times 59.7 \div 359.05 = 4202.88 \div 359.05 = 11.7055$ , the area of the third section;  $73.5 \times 62.6 \div 359.05 = 4601.10 \div 359.05 = 12.8146$ , the area of the fourth section; and  $76.2 \times 65.3 \div 359.05 = 4975.86 \div 359.05 = 13.8584$  ale gallons, the area of the fifth section.

## PROBLEM XII.

*To deduct the heat from Common Brewers' warm wort.*

## EXAM. 2.

B. F. G.

10)	72	1	2	warm gange.
	7	0	8.5	deduction.
	<u>65</u>	<u>0</u>	<u>2.5</u>	neat gauge.

*Note.* Here the decimal part of a gallon, in the deduction, is only .3; but it is called .5, according to Note 2, in the Gauging.

EXAM. 3.

B. F. G.

$$\begin{array}{r} 10)29 \quad 3 \quad 8 \text{ warm gauge.} \\ \quad 3 \quad 0 \quad 0 \text{ deduction.} \\ \hline \quad 26 \quad 3 \quad 8 \text{ Ans.} \\ \hline \hline \end{array}$$

*Note.* According to the observation in Note 2, of the Gauging, the deduction, in the last Example, becomes exactly 3 barrels.

SECTION III.

THE METHOD OF GAUGING AND ULLAGING CASKS,  
AS PRACTISED IN THE EXCISE.

CASK GAUGING.

PROBLEM III.

*To gauge and fix a cask of the first variety, as  
practised in the Excise.*

EXAM. 2.

*By Rule I.*

Bung diameter .....	30.9 inches.
Head diameter .....	24.6 inches.
Difference .....	6.3 inches.
Multiplier .....	.7
Product .....	4.41
Head diameter .....	24.6
Mean diameter .....	29.01 inches.
Ditto .....	29.01 inches.

2901  
26109  
5802  
841.5801  
46.7  
58910607  
50494806  
33663204

Divisor 359.05)39301.79067(109.469 ale gallons

Also,  $39301.79067 \div 294.12 = 133.625$ , the content in wine gallons.

BY THE SLIDING RULE.

The difference between the head and bung diameters is 6.3 inches; against this number on the line of inches, we have 4.4 on the line marked *spheroid*, which being added to 24.6, the head diameter, gives 29 inches, for the mean diameter. Then,

	On D.	On C.	On D.	On C.
As	$\left\{ \begin{array}{l} 18.95 \\ 17.15 \end{array} \right\}$	:	46.7 :: 29.0 :	$\left\{ \begin{array}{l} 109.4 \text{ ale gallons.} \\ 123.6 \text{ wine gallons.} \end{array} \right\}$

EXAM. 3.

By Rule II.

Bung diameter .....	26.2 inches
Head diameter .....	21.4 inches.
Difference .....	4.8 inches.
Multiplier .....	.68
	<hr/> 384
	288
Product .....	<hr/> 3264
Head diameter .....	21.4
Mean diameter .....	<hr/> <u>24.664 inches.</u>

The areas answering to the mean diameter 24.7 inches, are 1.6991 ale, and 2.0743 wine gallons; then  $.6991 \times 32.5 = 55.220$ , the content in ale gallons; and  $2.0743 \times 32.5 = 67.414$ , the content in wine gallons.

BY THE SLIDING RULE.

The difference of the diameters is 4.8 inches;

against this number on the line of inches, we find 3.34, on the line marked *spheroid*, which being added to 21.4, the head diameter, gives 24.74 inches, for the mean diameter. Then,

	On D.	On C.	On D.	On C.
As	$\left\{ \begin{array}{l} 18.95 \\ 17.15 \end{array} \right\}$	: 32.5 ::	24.74 :	$\left\{ \begin{array}{l} 55.2 \text{ ale gallons.} \\ 67.4 \text{ wine gallons.} \end{array} \right\}$

EXAM. 4.

*By Rule II.*

Here  $23.4 - 19.6 = 3.8$  inches, the difference of the diameters; and  $3.8 \times .68 = 2.584$ ; then  $19.6 + 2.584 = 22.184$  inches, the mean diameter. The areas corresponding to 22.2 inches, are 1.3726 ale, and 1.6757 wine gallons; then  $1.3726 \times 27.7 = 38.021$ , the content in ale gallons; and  $1.6757 \times 27.7 = 46.416$ , the content in wine gallons.

BY THE SLIDING RULE.

Here the difference of the diameters is 3.8 inches: against this number on the line of inches, we have 2.65 on the line marked *spheroid*; and  $19.6 + 2.65 = 22.25$  inches, the mean diameter. Then,

	On D.	On C.	On D.	On C.
As	$\left\{ \begin{array}{l} 18.95 \\ 17.15 \end{array} \right\}$	: 27.7 ::	22.23 :	$\left\{ \begin{array}{l} 38.0 \text{ ale gallons.} \\ 46.4 \text{ wine gallons.} \end{array} \right\}$

# PROBLEM IV.

To gauge and fix a cask of the second variety, as practised in the Excise.

## EXAM. 2.

By Rule I.

Long diameter .....	30.9 inches.
Head diameter .....	24.6 inches.
Difference .....	<u>6.3 inches.</u>
Multiplier .....	<u>.64</u>
	252
	378
Product .....	4.032
Head diameter .....	24.600
Mean diameter . . . . .	<u>28.632 inches.</u>

Then  $(28.632 \times 28.632 \times 46.7) \div 359.05 = 319.791424 \times 46.7) \div 359.05 = 38284.2595008 \div 359.05 = 106.62654$ , the content in ale gallons; and  $38284.2595008 \div 294.12 = 130.16544$ , the content in wine gallons.

## BY THE SLIDING RULE.

Here the difference of the diameters is 6.3 inches; against this number on the line of inches, we find 4.0 on the line marked *2nd Variety*; and  $24.6 + 4.0 = 28.6$  inches, the mean diameter. Then,

On D.    On C.    On D.    On C.  
 As  $\left\{ \begin{matrix} 18.95 \\ 17.15 \end{matrix} \right\} : 46.7 :: 28.6 : \left\{ \begin{matrix} 106.6 \text{ ale gallons.} \\ 130.1 \text{ wine gallons.} \end{matrix} \right.$

## EXAM. 3.

*By Rule II.*

Here  $26.2 - 21.4 = 4.8$  inches, the difference of the diameters; and  $4.8 \times .62 = 2.976$ ; then  $21.4 + 2.976 = 24.376$  inches, the mean diameter. The areas answering to 24.4 inches, are 1.6581 ale, and 2.0242 wine gallons; then  $1.6581 \times 32.5 = 53.8883$ , the content in ale gallons; and  $2.0242 \times 32.5 = 65.7865$ , the content in wine gallons.

## BY THE SLIDING RULE.

The difference of the diameters is 4.8 inches; against this number on the line of inches, we have 3.04 on the line marked *2nd Variety*; and  $21.4 + 3.04 = 24.44$  inches, the mean diameter. Then,

	On D.	On C.	On D.	On C.
As	$\left\{ \begin{array}{l} 18.95 \\ 17.15 \end{array} \right\}$	:	$32.5 :: 24.44 :$	$\left\{ \begin{array}{l} 53.9 \text{ ale gallons} \\ 65.8 \text{ wine gallons} \end{array} \right\}$

## EXAM. 4.

*By Rule II.*

Here  $23.4 - 19.6 = 3.8$  inches, the difference of the diameters; and  $3.8 \times .62 = 2.356$ ; then  $19.6 + 2.356 = 21.956$  inches, the mean diameter. The areas corresponding to 22.0 inches, are 1.3480 ale, and 1.6456 wine gallons; then  $1.348 \times 27.7 = 37.3396$ , the content in ale gallons; and  $1.6456 \times 27.7 = 45.58312$ , the content in wine gallons.

## BY THE SLIDING RULE.

The difference of the diameters is 3.8 inches; opposite this number on the line of inches, we find 2.4 on the line marked *2nd Variety*; and  $19.6 + 2.4 = 22.0$  inches, the mean diameter. Then,

	On D.	On C.	On D.	On C.
As	$\left\{ \begin{array}{l} 18.95 \\ 17.15 \end{array} \right\}$	:	27.7 :: 22.0 :	$\left\{ \begin{array}{l} 37.3 \text{ ale gallons.} \\ 45.6 \text{ wine gallons.} \end{array} \right\}$

### PROBLEM V.

To gauge and fix a cask of the third variety, as practised in the Excise.

#### EXAM. 2.

By Rule 1.

Here  $30.9 - 24.6 = 6.3$  inches, the difference of the diameters; and  $6.3 \times .57 = 3.591$ ; then  $24.6 + 3.591 = 28.191$  inches, the mean diameter. Now,  $(28.191 \times 28.191 \times 46.7) \div 359.05 = (794.732481 \times 46.7) \div 359.05 = 37114.0068627 \div 359.05 = 103.36723$ , the content in ale gallons; and  $37114.0068627 \div 294.12 = 126.18661$ , the content in wine gallons.

*Note.* In solving these questions, the Rule given in the Problem is called Rule I.; and the method by the Tables of Ale and Wine Areas, is denominated Rule II.

#### BY THE SLIDING RULE.

As the third variety of casks is not placed on any of the slides, we must make use of the mean diameter found by the multiplier; Hence,

	On D.	On C.	On D.	On C.
As	$\left\{ \begin{array}{l} 18.95 \\ 17.15 \end{array} \right\}$	:	46.7 :: 28.2 :	$\left\{ \begin{array}{l} 103.3 \text{ ale gallons.} \\ 126.2 \text{ wine gallons.} \end{array} \right\}$

## EXAM. 3.

*By Rule II.*

Here  $26.2 - 21.4 = 4.8$  inches, the difference of the diameters; and  $4.8 \times .55 = 2.64$ ; then  $21.4 + 2.64 = 24.04$  inches, the mean diameter. The areas corresponding to 24.0 inches, are 1.6042 ale, and 1.9584 wine gallons; then  $1.6042 \times 32.5 = 52.1365$ , the content in ale gallons; and  $1.9584 \times 32.5 = 63.648$ , the content in wine gallons.

## BY THE SLIDING RULE.

	On D.	On C.	On D.	On C.
As	$\left\{ \begin{array}{l} 18.95 \\ 17.15 \end{array} \right\}$	:	$32.5 :: 24.04 :$	$\left\{ \begin{array}{l} 52.1 \text{ ale gallons.} \\ 63.6 \text{ wine gallons.} \end{array} \right\}$

## EXAM. 4.

*By Rule II.*

Here  $23.4 - 19.6 = 3.8$  inches, the difference of the diameters; and  $3.8 \times .55 = 2.09$ ; then  $19.6 + 2.09 = 21.69$  inches, the mean diameter. The areas answering to 21.7 inches, are 1.3114 ale, and 1.6010 wine gallons; then  $1.3114 \times 27.7 = 36.32578$ , the content in ale gallons; and  $1.601 \times 27.7 = 44.3477$ , the content in wine gallons.

## BY THE SLIDING RULE.

	On D.	On C.	On D.	On C.
As	$\left\{ \begin{array}{l} 18.95 \\ 17.15 \end{array} \right\}$	:	$27.7 :: 21.69 :$	$\left\{ \begin{array}{l} 36.3 \text{ ale gallons.} \\ 44.3 \text{ wine gallons.} \end{array} \right\}$

PROBLEM VI.

To gauge and fix a cask of the fourth variety, as practised in the Excise.

EXAM. 2.

By Rule I.

Bung diameter .....	30.9 inches.
Head diameter .....	24.6 inches.
Difference .....	6.3 inches.
Multiplier .....	.52
	<hr/>
	126
	315
Product .....	3.276
Head diameter .....	24.6
Mean diameter .....	<u>27.876 inches.</u>

Then  $(27.876 \times 27.876 \times 46.7) \div 359.05 = 777.071376 \times 46.7 \div 359.05 = 36289.2332592 \div 359.05 = 101.07018$ , the content in ale gallons; and  $36289.2332592 \div 294.12 = 123.3824$ , the content in wine gallons.

BY THE SLIDING RULE.

On D.    On C.    On D.    On C.  
As  $\left\{ \begin{matrix} 18.95 \\ 17.15 \end{matrix} \right\} : 46.7 :: 27.87 : \left\{ \begin{matrix} 101.1 \text{ ale gallons.} \\ 123.4 \text{ wine gallons.} \end{matrix} \right.$

EXAM. 3.

By Rule II.

Here  $26.2 - 21.4 = 4.8$  inches, the difference of the diameters; and  $4.8 \times .5 = 2.40$ ; then  $21.4 +$   
U

$24 = 23.4$  inches, the mean diameter. The areas corresponding to this diameter, are  $157.5$  ale, and  $125.4$  wine gallons; then  $157.5 \times 32.5 = 51268.75$ , the content in ale gallons; and  $125.4 \times 32.5 = 40755$  the content in wine gallons.

## BY THE SLIDING RULE.

	On D.	On C.	On D.	On C.
As	$\left\{ \begin{array}{l} 18.35 \\ 17.15 \end{array} \right\}$	:	$32.5 :: 23.4 :$	$\left\{ \begin{array}{l} 51.3 \text{ ale gallons.} \\ 42.6 \text{ wine gallons.} \end{array} \right\}$

## EXAM. 4.

By Rule II.

Here  $23.4 - 19.6 = 3.8$  inches, the difference of the diameters; and  $3.8 \times .5 = 1.90$ ; then  $19.6 + 1.9 = 21.5$  inches, the mean diameter. The areas answering to this diameter, are  $128.4$  ale, and  $157.17$  wine gallons: then  $128.4 \times 27.7 = 35600.98$ , the content in ale gallons; and  $157.17 \times 27.7 = 43500.99$ , the content in wine gallons.

## BY THE SLIDING RULE.

	On D.	On C.	On D.	On C.
As	$\left\{ \begin{array}{l} 18.95 \\ 17.15 \end{array} \right\}$	:	$27.7 :: 21.5 :$	$\left\{ \begin{array}{l} 35.6 \text{ ale gallons.} \\ 43.5 \text{ wine gallons.} \end{array} \right\}$

## PROBLEM VII.

*To find the content of a cask, by the Diagonal Rod, without paying any regard to its variety.*

## EXAM. 2.

## BY THE DIAGONAL ROD.

Opposite 36.2 inches, the given diagonal, we find 106.0 ale gallons, and 129.2 wine gallons, the contents required.

## BY THE SLIDING RULE.

On D.	On C.	On D.	On C.
As $\left\{ \begin{array}{l} 21.2 \\ 19.2 \end{array} \right\}$	$36.2$	$36.2$	$\left\{ \begin{array}{l} 106.0 \text{ ale gallons.} \\ 129.2 \text{ wine gallons.} \end{array} \right\}$

*By Note I.*

Here  $36.2 \times 36.2 \times 36.2 = 1310.44 \times 36.2 = 47437.928$ , the cube of the diagonal; then  $47437.928 \times .002228 = 105.691703584$ , the content, in ale gallons; and  $47437.928 \times .00272 = 129.03116416$  the content in wine gallons.

## EXAM. 3.

## BY THE DIAGONAL ROD.

Opposite 28.6 inches, the given diagonal, we find 52.2 ale gallons, and 63.8 wine gallons, the contents required.

## BY THE SLIDING RULE.

On D.	On C.	On D.	On C.
As $\left\{ \begin{array}{l} 21.2 \\ 19.2 \end{array} \right\} : 28.6 :: 28.6 : \left\{ \begin{array}{l} 52.2 \text{ ale gall.} \\ 63.5 \text{ wine gall.} \end{array} \right.$			

*By Note I.*

Here  $28.6 \times 28.6 \times 28.6 = 817.96 \times 28.6 = 23393.656$ , the cube of the diagonal; then  $23393.656 \times .002228 = 52.121065568$ , the content in ale gallons; and  $23393.656 \times .00272 = 63.63074432$ , the content in wine gallons.

## EXAM. 4.

## BY THE DIAGONAL ROD.

Opposite 25.5 inches, the given diagonal, we find 37.0 ale gallons, and 45.1, wine gallons, the contents required.

## BY THE SLIDING RULE.

On D.	On C.	On D.	On C.
As $\left\{ \begin{array}{l} 21.2 \\ 19.2 \end{array} \right\} : 25.5 :: 25.5 : \left\{ \begin{array}{l} 36.9 \text{ ale gall.} \\ 44.9 \text{ wine gall.} \end{array} \right.$			

*By Note I.*

Here  $25.5 \times 25.5 \times 25.5 = 650.25 \times 25.5 = 16581.375$ , the cube of the diagonal; then  $16581.375 \times .002228 = 36.9433035$ , the content in ale gallons; and  $16581.375 \times .00272 = 45.10134$ , the content in wine gallons.

## PROBLEM VIII.

To find the contents of casks in general, from the head diameter, bung diameter, and length.

EXAM. 2.

By Rule I.

Here  $30.9 \times 30.9 \times 39 = 954.81 \times 39 = 37237.59$ , thirty-nine times the square of the bung diameter;  $24.6 \times 24.6 \times 25 = 605.16 \times 25 = 15129.00$ , twenty-five times the square of the head diameter;  $30.9 \times 24.6 \times 26 = 760.14 \times 26 = 19763.64$ , twenty-six times the product of the diameters; then  $(37237.59 + 15129 + 19763.64) \times 46.7 \times .00034 = 72130.23 \times 46.7 \times .00034 = 3368481.741 \times .00034 = 1145.28379194$ ; hence  $\frac{1145.2837}{11} = 104.1167$ , the content in ale gallons;

and  $\frac{1145.2837}{9} = 127.2537$ , the content in wine gallons.

BY THE SLIDING RULE.

Here  $24.6 \div 30.9 = .79$ , the quotient of the head, divided by the bung diameter. Opposite to this number, in the table, we find 20.74, and 18.77, the gauge-points for ale and wine gallons; then,

On D.      On C.      On D.      On C.

As  $\left\{ \begin{array}{l} 20.74 \\ 18.77 \end{array} \right\} : 46.7 :: 30.9 : \left\{ \begin{array}{l} 104.1 \text{ ale gall.} \\ 127.2 \text{ wine gall.} \end{array} \right.$

EXAM. 3.

By Rule II.

Here  $\frac{21.4}{26.2} = .81 \frac{178}{262}$ , the quotient of the head divided by the bung diameter. The multiplier corresponding to this quotient, is .00238 for ale, and .0029056 for wine gallons; then  $.00238 \times 26.2 \times 32.5 = .00238 \times 686.44 \times 32.5 = 1.6337272 \times 32.5 = 53.096134$ , the content in ale gallons;

U 3

and  $.0029056 \times 686.44 \times 32.5 = 1.994520064 \times 32.5 = 64.82190208$ , the content in wine gallons.

*Note.* In order to find the multiplier answering to  $.81 \frac{178}{262}$ , we proceed in the following manner, as directed in Note I. of the Gauging: The multiplier opposite to .81 is .002366, and that opposite to .82 is .0023867; then  $(.0023867 - .002366) \times \frac{178}{262} = .0000207 \times \frac{178}{262} = \frac{.0036846}{262} = .000014$ ; and  $.002366 + .000014 = .00238$ , the multiplier for ale gallons, corresponding to  $.81 \frac{178}{262}$ . In the same manner we find .0029066 to be the multiplier corresponding to  $.81 \frac{178}{262}$ , for wine gallons.

#### BY THE SLIDING RULE.

The gauge-points opposite to .81, in the table, are 20.56, and 18.61, for ale and wine gallons; then,

$$\begin{array}{ccccccc} \text{On D.} & & \text{On C.} & & \text{On D.} & & \text{On C.} \\ \text{As } \left\{ \begin{array}{l} 20.56 \\ 18.61 \end{array} \right\} & : & 32.5 & :: & 26.2 & : & \left\{ \begin{array}{l} 53.1 \text{ ale gall.} \\ 64.8 \text{ wine gall.} \end{array} \right. \end{array}$$

#### EXAM. 4.

*By Rule II.*

Here  $\frac{19.6}{23.4} = .83 \frac{178}{234} = .83\frac{1}{4}$  nearly, the quotient of the head, divided by the bung diameter. The multiplier answering to this quotient is .0024232 for ale, and .9929583 for wine gallons; then  $.0024232 \times 23.4^2 \times 27.7 = .0024232 \times 547.56 \times 27.7 = 1.326847392 \times 27.7 = 36.7586727584$ , the content in ale gallons; and  $.9929583 \times 547.56 \times 27.7 = 1.619846748 \times 27.7 = 44.8697549196$ , the content in wine gallons.

*Note.* The multiplier answering to  $.83\frac{1}{4}$  is found as directed in Note 2, of the Gauging.

#### BY THE SLIDING RULE.

As the quotient of the head by the bung diameter, is nearer .84 than .83, we take the gauge points oppo-

site to .84; which are 20.29, and 18.36 for ale and wine gallons; then,

$$\begin{array}{ccccccc} & \text{On D.} & & \text{On C.} & & \text{On D.} & & \text{On C.} \\ \text{As.} & \left\{ \begin{array}{l} 20.29 \\ 18.36 \end{array} \right\} & : & 27.7 & :: & 23.4 & : & \left\{ \begin{array}{l} 36.8 \text{ ale gall.} \\ 44.9 \text{ wine gall.} \end{array} \right\} \end{array}$$

### PROBLEM IX.

*To find the true content of any cask without paying regard to its variety, by means of four dimensions; namely, the length, the bung and head diameters, and the middle diameter, between the bung and head.*

#### EXAM. 2.

##### *By Rule I.*

Here  $29 \times 29 \times 4 = 841 \times 4 = 3364$ , four times the square of the middle diameter; and  $30.9^2 + 24.6^2 = 954.81 + 605.16 = 1559.97$ , the sum of the squares of the bung and head diameters; then  $(3364 + 1559.97) \times 46.7 = 4923.97 \times 46.7 = 229949.399$ ; and  $229949.399 \div 2154.8 = 106.739$ , the content in ale gallons; also,  $229949.399 \div 1764.72 = 130.303$ , the content in wine gallons.

The Method of Gauging Casks by the Calipers, as  
 explained in the Part of Great Britain and Ireland  
 of the Port Gaugers of the Excise and Customs.

TABLE 2

To find the true dimensions.

	Inches
Innermost diameter being measured .....	22.5
Width the thickness of the stave .....	1.0
Innermost diameter being measured .....	23.5
Innermost perpendicular being measured .....	24.0
Sum of the .....	97.0
True being diameter .....	24.5
<hr/>	
True inches .....	24.5
Being diameter 14.5 — 14.5 — diameter .....	1.0
Innermost true inches .....	23.5
<hr/>	
Back most diameter .....	27.0
Width .....	1.0
Sum of the .....	28.0
True back most diameter .....	27.5
<hr/>	
Front most diameter .....	28.5
Width .....	1.0
Sum of the .....	29.5
Mean front most diameter .....	28.5
Mean back most diameter .....	27.5
Sum of the .....	56.0
True being diameter .....	28.0

	<i>Inches.</i>
Length .....	36.4
Ditto .....	36.3
Ditto .....	36.5
Divide by .....	3)109.2
Mean length .....	36.4
Deduction for the heads, 2.4 — 2.0 .....	0.4
Difference .....	36.0
Deduction for the variety .....	0.8
True length .....	35.2

<i>True dimensions.</i>	<i>Inches.</i>
Length .....	35.2
Head diameter .....	28.4
Bung diameter .....	34.5
Wet Inches .....	30.8

*To find the mean diameter.*

Set the brass index on the slide, to the head diameter 28.4, on the lower line of the stock ; then against the bung diameter 34.5, on the same line of the stock, we have 4.2 nearly on the line marked spheroid : and opposite this number on the lower line of the slide, we have 32.6, the mean diameter, on the lower line of the stock.

*To find the content.*

Set the guage-point on D, to the length 35.2 on C ; then against the mean diameter 32.6 on D, is 127, very nearly, on C, the content in wine gallons.

*To find the ullage.*

Set the bung diameter 34.5 on N, to 100 on S. L. ; then against the wet inches 30.8 on N, we have 95 the fourth number on S. L.

Again, set 95 on B, to 100 on A ; then against 127, X 3,

the content of the cask on A, is 121 nearly, the content of the ullage on B.

### EXAM. 3.

In casting the contents of the casks given in this Example, let Sl. denote the Slide; B. I. the Brass Index on the Slide; St. the Stock; Sp. Spheroid; and G. P. the Gauge-Point on the Slide D. By this means we shall be able to abridge the method of expressing the operations of finding the mean diameters, contents and ullages.

#### No. 1.

On Sl. On St. On St. On Sp.

As B. I. : 22.4 :: 27.3 : 3.4; then opposite this number on the lower line of the slide, we have 25.8, the mean diameter, on the lower line of the stock.

On D. On C. On D. On C.

As G. P. : 47.5 :: 25.8 : 107, the content of the cask

On N. On S. L. On N. On S. L.

As 27.3 : 100 :: 24.7 : 96, the fourth number.

On A. On B. On A. On B.

As 100 : 96 :: 107 : 103, the ullage required

#### No. 2.

On Sl. On St. On St. On Sp.

As B. I. : 21.3 :: 27.9 : 4.6; then opposite this number on the lower line of the slide, we have 25.9, the mean diameter on the lower line of the stock.

On D. On C. On D. On C.

As G. P. : 46.8 :: 25.9 : 106, the content of the cask

On N. On S. L. On N. On S. L.

As 27.9 : 100 :: 25.9 : 97.6, fourth number.

On A. On B. On A. On B.

As 100 : 97.6 :: 106 : 103, the ullage required

## No. 3.

On Sl. On St. On St. On Sp.  
 As B. I. : 21.7 :: 27.8 : 4.2 ; then opposite this  
 number on the lower line of the slide we have 25.9  
 the mean diameter on the lower line of the stock.

On D. On C. On D. On C.  
 As G. P. : 48.4 :: 25.9 : 110, the content of the cask.

On N. On S.L. On N. On S.L.  
 As 27.8 : 100 :: 26.0 : 98, the fourth number.

On A. On B. On A. On B.  
 As 100 : 98 :: 110 : 108, the ullage required.

## No. 4.

On Sl. On St. On St. On Sp.  
 As B. I. : 22.3 :: 27.8 : 3.8 ; then opposite this  
 number on the lower line of the slide, we have 26.1,  
 the mean diameter on the lower line of the stock.

On D. On C. On D. On C.  
 As G. P. : 47.2 :: 26.1 : 109, the content of the cask.

On N. On S.L. On N. On S.L.  
 As 27.8 : 100 :: 25.7 : 97, the fourth number.

On A. On B. On A. On B.  
 As 100 : 97 :: 109 : 106, the ullage required.

## No. 5.

On Sl. On St. On St. On Sp.  
 As B. I. : 22.3 :: 27.5 : 3.6 ; then opposite this  
 number on the lower line of the slide, we have 25.9,  
 the mean diameter on the lower line of the stock.

On D. On C. On D. On C.  
 As G. P. : 47.1 :: 25.9 : 107, the content of the cask.

On N. On S.L. On N. On S.L.  
 As 100 : 27.5 :: 25.9 : 98, the fourth number.

On A. On B. On A. On B.  
 As 100 : 98 :: 107 : 105, the ullage required.

## No. 6.

On Sl. On St. On St. On Sp.

As B. 1. : 22.3 :: 27.5 : 3.6; then opposite this number on the lower line of the slide, we have 25.9, the mean diameter on the lower line of the stock.

On D. On C. On D. On C.

As G.P. : 48.3 :: 25.9 : 110, the content of the cask.

On N. On S.L. On N. On S.L.

As 100 : 27.5 :: 25.7 : 98, the fourth number.

On A. On B. On A. On B.

As 100 : 98 :: 109 : 108, the ullage required.

## SECTION IV.

MALT GAUGING, OR THE METHOD OF GAUGING AND  
FIXING MALTSTERS' UTENSILS, AS PRACTISED IN THE  
EXCISE.

## PROBLEM I.

*To gauge and fix a Maltster's Cistern, in the form of  
a parallelopipedon.*

## EXAM. I.

*The Method of tabulating the Cistern, given in this  
Example.*

Inches.	Contents.	Inches.	Contents.	Inches.	Contents.
20.0	57.200 .286	20.8	59.488 .286	21.6	61.776 .286
20.1	57.486 .286	20.9	59.774 .286	21.7	62.062 .286
20.2	57.772 .286	21.0	60.060 .286	21.8	62.348 .286
20.3	58.058 .286	21.1	60.346 .286	21.9	62.634 .286
20.4	58.344 .286	21.2	60.632 .286	22.0	62.920 .286
20.5	58.630 .286	21.3	60.918 .286	22.1	63.206 .286
20.6	58.916 .286	21.4	61.204 .286	22.2	63.492 .286
20.7	59.202 .286	21.5	61.490 .286	22.3	63.778 .286

TABLE CONTINUED.

Inches.	Contents.	Inches.	Contents.	Inches.	Contents.
22.4	64.064 .286	23.3	66.638 .286	24.2	69.212 .286
22.5	64.350 .286	23.4	66.924 .286	24.3	69.498 .286
22.6	64.636 .286	23.5	67.210 .286	24.4	69.784 .286
22.7	64.922 .286	23.6	67.496 .286	24.5	70.070 .286
22.8	65.208 .286	23.7	67.782 .286	24.6	70.356 .286
22.9	65.494 .286	23.8	68.068 .286	24.7	70.642 .286
23.0	65.780 .286	23.9	68.354 .286	24.8	70.928 .286
23.1	66.066 .286	24.0	68.640 .286	24.9	71.214 .286
23.2	66.352 .286	24.1	68.926 .286	25.0	71.500

See the Gauging, in which a Table Book is formed from above Table of Inches and Contents.

## EXAM. 2.

BY THE PEN.

*To find the area and content.*

Here  $128.6 \times 85.4 \div 2150.42 = 10982.44 - 2150.42 = 5.107$  bushels, the area of the cistern and  $5.107 \times 52.8 = 269.6496$  bushels, the content required.

## BY THE SLIDING RULE.

*M. B.                  Length.                  Breadth.                  Area.*

As 2150.42 on A : 128.6 on B :: 85.4 on A : 5.11  
on B.

And,

*Unity.                  Area.                  Depth.                  Content.*

As 1 on A : 5.11 on B :: 52.8 on A : 269.65  
on B.

Or,

*Length.                  Depth.                  Breadth.                  Content.*

As 128.6 on B : 52.8 on MD :: 85.4 on A : 269.65  
on B.

## EXAM. 3.

Here  $5.107 \times 43.7 = 223.1759$  bushels, the content required.

## PROBLEM II.

To gauge a couch of malt contained in a rectangular frame.

## EXAM. 2.

BY THE PEN.

To find the area and content.

Here  $148 \times 125 \div 2150.42 = 8.602$  bushels, the area; and  $8.602 \times 26.8 = 30.5336$  bushels, the content required.

BY THE SLIDING RULE.

*M. B.                  Length.                  Breadth.                  Area.*

As 2150.42 on A : 148 on B :: 125 on A : 8.6  
on B.

And,

<i>Unity.</i>	<i>Area.</i>	<i>Depth.</i>	<i>Content.</i>
As 1 on A	: 8.6 on B	:: 26.8 on A	: 230.53 on B.

Or,

<i>Length.</i>	<i>Depth.</i>	<i>Breadth.</i>	<i>Content.</i>
As 148 on B	: 26.8 on MD	:: 125 on A	: 230.53 on B.

## EXAM. 3.

Here  $8.602 \times 18.7 = 160.8574$  bushels, the content required.

## PROBLEM III.

*To gauge a couch of malt, not in a frame, but laid upon the floor, in a square or rectangular form, with one or more of its sides slanting.*

## EXAM. 2.

BY THE PEN.

*To find the area and content.*

Here  $138 \times 113 \div 2150.42 = 15594 \div 2150.42 = 7.251$  bushels, the area of the couch; and  $7.251 \times 28.6 = 207.3786$  bushels, the content required.

BY THE SLIDING RULE.

<i>Length.</i>	<i>Depth.</i>	<i>Breadth.</i>	<i>Content.</i>
As 138 on B	: 28.6 on MD	:: 113 on A	: 207.57 on B.

## PROBLEM IV.

*To gauge a couch of malt either in the form of a cone, or a conical frustum.*

EXAM. 2.

BY THE PEN.

*To find the content.*

Here  $\frac{144 + 64}{2} = \frac{208}{2} = 104$ , the mean diameter,

when the frustum is reduced to a cylinder; then,  
 $104 \times 104 \times 28.2 = 10816 \times 28.2 = 305011.2$ ;  
 and  $305011.2 \div 2738 = 111.399$ , the content in  
 malt bushels,

BY THE SLIDING RULE.

On D. On C. On D. On C.

As 52.32 : 28.2 :: 104 ; 111.39, content.

## PROBLEM V.

*To gauge a rectangular floor of malt.*

EXAM. 2.

BY THE PEN.

*To find the content.*

*Inches.*

435 length.

218 breadth.

3480

435

870

94830 product.

5.2 depth.

189660

474150

Divisor 2150.42) 493116.0 (229.311 bushels.

Y

## BY THE SLIDING RULE.

<i>Length.</i>	<i>Depth.</i>	<i>Breadth.</i>	<i>Content.</i>
As 485 on B	: 5.2 on MD	:: 218 on A	: 229.31
on B.			

## EXAM. 3.

## BY THE PEN.

Here  $485 \times 224 \times 3.4 = 108640 \times 3.4 = 369376$   
 and  $369376 \div 2150.42 = 171.769$ , the content is  
 malt bushels.

## BY THE SLIDING RULE.

<i>Breadth.</i>	<i>Depth.</i>	<i>Length.</i>	<i>Content.</i>
As 224 on B	: 3.4 on MD	:: 485 on A	: 171.7
on B.			

## PROBLEM VI.

*To find the content of a rectangular floor of malt by  
 another method.*

## EXAM. 2.

## BY THE RULE.

*Inches:*

435 length.

109 half the breadth.

3915

435

47.415 product.

5.2 depth.

94830

237075

246.5580 product.

.930 factor.

739674

2219022

229.29894 content.

*By the first Note.*

Here  $435 \times 109 \times 5.2 = 246.558$  false con.

And  $\frac{246.558 \times 7}{100} = \frac{1725.906}{100} = 17.259$  deduction.

229.299 true con.

### EXAM. 3.

*By the third Note.*

*Bushels.*

Here ..... 18.6, the area of the floor.  
Multiply by ..... 6.7, the depth of the grain.

1302

1116

124.62 content.

### EXAM. 4.

*By the fourth Note.*

Here half the length of the floor is 50; then if we multiply 250 by 50, and cut off three figures, as decimals, we obtain 12.5 for the *false* area. This being multiplied by 6, gives 75 bushels, for the *false* content. Lastly, if we multiply 75 by 7, and cut off two figures for a decimal, we obtain 5.25 bushels for the deduction; hence the true content of the floor is 69.75 bushels.

## PROBLEM VII.

To gauge and fix a rectangular malt-kiln.

## EXAM. 2.

BY THE PER.

*Bushels.*

20.012 area.

4.7 depth.

---

140064

30048

---

---

91.0564 content.

BY THE SLIDING RULE.

<i>Length.</i>	<i>Area.</i>	<i>Depth.</i>	<i>Content.</i>
As 1 on A :	20.01 on B ::	4.7 on A :	91.05 on B.

## EXAM. 3.

BY THE PER.

Here  $50 \times 30 = 1500$ , the area of the well-hole ; and  $1500 \div 212 = 7$  inches, the number to be deducted from the length, in order to make an allowance for the well-hole ; hence, we have  $236 - 7 = 229$  inches, the true length of the kiln ; then  $229 \times 212 \div 2150.42 = 48548 \div 2150.42 = 22.576$  malt bushels, the area required.

PROOF.

Here  $236 \times 212 = 50032$ , the area of both the kiln and the well-hole ; and  $50032 - 1500 = 48532$ , the area of the kiln, in square inches ; then  $48532 \div 2150.42 = 22.568$ , its area in malt bushels, nearly as before.

## PROBLEM VIII.

*To find whether the duty will arise from the cistern,  
the couch, or the floor.*

EXAM. 2.

*Bushels.*

69.8 couch-gauge.

1.6 multiplier.

418.8

698

111.68 product.

Here the number of bushels obtained by multiplying the couch-gauge by 1.6, is less than the number of floor bushels; consequently, the charge will arise from the floor.

*Bushels.*

112.6 floor bushels.

.5 multiplier.

56.30 product.

Here the neat bushels are 56.3, the number upon which the duty must be charged.

## SECTION V.

## THE METHOD OF GAUGING AND INCHING DISTILLERS' UTENSILS.

## PROBLEM I.

*To gauge and inch a Wash Still.*

## EXAM. 1.

*The Method of tabulating the Wash Still, given in this Example.*

56 *	365.69 23.62	61	245.59 23.62	66	133.88 20.44		00.00

PROBLEM II.

*To find the content of a still head.*

EXAM. 2.

*To find the content.*

Here  $2.515 + 4.261 = 6.776$ , the sum of the top and bottom areas; also,  $8.843 \times 2 = 17.686$ , twice the area of the middle section; and  $6.703 + 7.856 \times 4 = 14.569 \times 4 = 58.276$ , four times the sum of the areas, at one fourth, and three-fourths, of the depth; then,

$$(6.776 + 17.686 + 58.276) \frac{40}{12} = \frac{82.738 \times 40}{12} =$$

$$\frac{3309.52}{12} = 275.793 \text{ wine gallons, the content of the head.}$$

Again,  $4.261 \times 6.2 = 26.418$  wine gallons, the content of the cylindrical collar; then,  $275.793 + 26.418 = 302.211$  wine gallons, the whole content required.

### PROBLEM III.

*To gauge and inch a distiller's oval wash-back, by the method of equi-distant ordinates.*

#### EXAM. 1.

*To find the area of the second Section.*

Here  $35.6 + 33.6 = 67.2$ , the sum of the extreme ordinates;  $(59.6 + 79.4 + 79.4 + 59.6) \times 4 = 278 \times 4 = 1112.0$ , four times the sum of all the even ordinates; and  $(72.6 + 81.6 + 72.6) \times 2 = 226.8 \times 2 = 453.6$ , twice the sum of all the ordinates; then,  $(67.2 + 1112.0 + 453.6) \times 4 = 1632.8 \times 4 = 6531.2$  square inches, the area of that part of the section circumscribed by the sides of the vessel and the two extreme ordinates.

Again  $\frac{67.2 \times 9.4}{3} = \frac{631.68}{3} = 210.56$  square inches,

the area of the two segments; and  $6531.2 + 210.56 = 6741.76$  square inches, the area of the whole section; then  $6741.76 \div 231 = 29.185$ , the area in wine gallons.

*To find the area of the third Section.*

Here  $27.0 + 27.0 = 54.0$ , the sum of the extreme ordinates;  $(56.1 + 76.8 + 76.8 + 56.1) \times 4 = 265.8 \times 4 = 1063.2$ , four times the sum of all the even ordinates; and  $69.7 + 79.0 + 69.7 \times 2 = 218.4 \times 2 = 436.8$ , twice the sum of all the odd ordinates; then

$(54.0 + 436.8 + 1063.2) \times 4 = 1554.0 \times 4 = 6216.0$  square inches, the area of that part of the section circumscribed by the sides of the vessel and the two extreme ordinates.

Again,  $\frac{54 \times 6.2}{3} = \frac{334.8}{3} = 111.6$  square inches, the area of the two segments; and  $6216.0 + 111.6 = 6327.6$  square inches, the area of the whole section; then  $6327.6 \div 231 = 27.392$ , the area in wine gallons.

*To find the area of the fourth section.*

Here  $20.4 + 20.4 = 40.8$ , the sum of the extreme ordinates;  $(53.0 + 74.1 + 74.1 + 53.0) \times 4 = 254.2 \times 4 = 1016.8$ , four times, the sum of all the even ordinates  $(67.0 + 76.4 + 67.0) \times 2 = 210.4 \times 2 = 420.8$ , twice the sum of all the odd ordinates; then  $(40.8 + 1016.8 + 420.8) \times 4 = 1478.4 \times 4 = 5913.6$  square inches, the area of that part of the section, circumscribed by the side of the vessel and the two extreme ordinates.

Again,  $\frac{40.8 \times 4}{3} = \frac{163.2}{3} = 54.4$  square inches, the area of the two segments; and  $5913.6 + 54.4 = 5968.0$ , square inches, the area of the whole section; then  $5968.0 \div 231 = 25.835$ , the area in wine gallons.

11	323.840 29.185	22	643.082 27.392	33	941.280 25.835		

## EXAM. 2.

*To find the area of the first section.*

Here  $44.2 + 44.3 = 88.5$ , the sum of the extreme ordinates;  $(66.8 + 82.2 + 82.1 + 66.8) \times 4 = 297.9 \times 4 = 1191.6$ , four times the sum of all the even ordinates;  $(77.6 + 84.2 + 77.5) \times 2 = 239.3 \times 2 = 478.6$ , twice the sum of all the odd ordinates; then  $(88.5 + 478.6 + 1191.6) \times 4 = 1758.7 \times 4 = 7034.8$  square inches, the area of that part of the section, circumscribed by the side of the vessel, and the two extreme ordinates.

Again,  $\frac{88.5 \times 12}{3} = \frac{1062.0}{3} = 354$  square inches, the area of the two segments; and  $354 + 7034.8 = 7388.8$  square inches, the area of the whole section; then  $7388.8 \div 231 = 31.986$ , the area in wine gallons.

*To find the area of the second section.*

Here  $39.3 + 39.2 = 78.5$ , the sum of the extreme ordinates;  $(62.7 + 81.1 + 81.0 + 62.6) \times 4 = 287.4 \times 4 = 1149.6$ , four times the sum of all the even ordinates;  $(75.1 + 81.6 + 75.2) \times 2 = 231.9 \times 2 = 463.8$ , twice the sum of all the odd ordinates; then,  $(78.5 + 463.8 + 1149.6) \times 4 = 1691.9 \times 4 = 6767.6$  square inches, the area of that part of the section, circumscribed by the side of the vessel and the two extreme ordinates.

Again,  $\frac{78.5 \times 9.4}{3} = \frac{737.90}{3} = 245.966$ , square inches, the area of the two segments; and  $245.966 + 6767.6 = 7013.566$  square inches, the area of the whole section; then  $7013.566 \div 231 = 30.361$ , the area in wine gallons.

*To find the area of the third section.*

Here  $32.5 + 32.6 = 65.1$ , the sum of the extreme ordinates;  $(59.1 + 78.5 + 78.4 + 59.2) \times 4 = 275.2 \times 4 = 1100.8$ , four times the sum of all the even ordinates;  $(72.7 + 79.0 + 77.2) \times 2 = 228.9 \times 2 = 457.8$ , twice the sum of all the odd ordinates; then  $(457.8 + 1100.8 + 65.1) \times 4 = 1623.7 \times 4 = 6494.8$  square inches, the area of that part of the section, circumscribed by the sides of the vessel, and the two extreme ordinates.

$$\text{Again, } \frac{65.1 \times 6.2}{3} = \frac{403.62}{3} = 134.54 \text{ square inches}$$

the area of the two segments; and  $134.54 + 6494.8 = 6629.34$  square inches, the area of the whole section; then  $6629.34 \div 231 = 28.698$ , the area in wine gallons.

*To find the area of the fourth section.*

Here  $25.8 + 25.7 = 51.5$ , the sum of the extreme ordinates;  $55.8 + 75.8 + 75.7 + 55.8) \times 4 = 263.1 \times 4 = 1052.4$ , four times the sum of all the even ordinates;  $(69.5 + 76.4 + 69.5) \times 2 = 215.4 \times 2 = 430.8$ , twice the sum of all the odd ordinates; then  $(430.8 + 1052.4 + 51.5) \times 4 = 1534.7 \times 4 = 6138.8$  square inches, the area of that part of the section, circumscribed by the sides of the vessel, and the two extreme ordinates.

$$\text{Again, } \frac{51.5 \times 4}{3} = \frac{206.0}{3} = 68.66 \text{ square inches, the}$$

area of the two segments; and  $68.66 + 6138.8 = 6207.46$  square inches, the area of the whole section; then  $6207.46 \div 231 = 26.872$ , the area in wine gallons.

## SECTION VI.

THE METHOD OF GAUGING AND FIXING THE UTENSILS  
OF SOAP-MAKERS, STARCH-MAKERS, AND GLASS-  
MAKERS, AS PRACTISED IN THE EXCISE.

## SOAP GAUGING.

## PROBLEM.

*To find the area and content of a rectangular bar-  
soap-frame, in pounds avoirdupois.*

## EXAM. 2.

*Pounds.*

24.1 area.

4.8 depth.

1928

964

115.68 content.

## EXAM. 3.

*Pounds.*

24.87 area.

4.6 depth.

14922

9948

114.402 content.

EXAM. 4.

*Inches.*

43 length.

14 breadth.

172

48

28.00 602 (21.50, area in pounds hot.

27.14 602 (22.18, area in pounds cold.

Then  $21.5 \times 58 = 1247.0$ , the content in pounds hot; and  $22.18 \times 58 = 1286.44$ , the content in pounds cold.

STARCH GAUGING.

PROBLEM I.

To gauge and fix a starch-vat in the form of a parallelopipedon.

EXAM. 2.

*Bushels.*

9.026 area.

28.6 depth:

54 15 6

722 08

1805 2

258.1436 content.

*Pounds.*

225.6 5 area.

2 8.6 depth.

1353 9 0

18052 0

45130

6453.5 9 0 content.

EXAM. 3.

*Bushels.*

10.69 8 area.

26.4 depth.

42 79 2

641 88

213 9 6

282.427 2 content.

*Pounds.*

267.4 5 area.

2 6.4 depth.

1069 8 0

16047 0

53490

7060.6 8 0 content.

## EXAM. 4.

Here  $(225.8 \times 156.6) \div 2228 = 35360.28 \div 2828 = 12.503$ , the area in bushels; and  $12.503 \times 25 = 312.575$ , the area in pounds, before fermentation.

Again,  $35360.28 \div 2386 = 14.819$ , the area in bushels; and  $14.819 \times 25 = 370.475$ , the area in pounds, after fermentation.

## PROBLEM II.

*To gauge and fix a starch-cut, in the form of the frustum of a cone.*

## EXAM. 1.

*To find the area of the second section.*

Here  $(96.4 \times 96.4) \div 3601 = 9292.96 \div 3601 = 2.580$  bushels, the area before fermentation; and  $9292.96 \div 3038 = 3.058$  bushels, the area after fermentation.

*To find the area of the third section.*

Here  $(94.3 \times 94.3) \div 3601 = 8892.49 \div 3601 = 2.469$  bushels, the area before fermentation; and  $8892.49 \div 3038 = 2.927$  bushels, the area after fermentation.

*To find the area of the fourth section.*

Here  $(92.5 \times 92.5) \div 3601 = 8556.25 \div 3601 = 2.376$  bushels, the area before fermentation; and  $8556.25 \div 3038 = 2.816$  bushels, the area after fermentation.

## EXAM. 2.

	<i>Areas.</i>	<i>Contents.</i>
1st section ...	$2.677 \times 10 = 26.77$	First division.
2nd section ..	$2.580 \times 10 = 25.80$	Second division.
3rd section ..	$2.469 \times 10 = 24.69$	Third division.
4th section ..	$2.376 \times 8.6 = 20.43$	Part of 4th divis.
Content .....	97.69	Bushels.
	25	
	488 45	
	1953 8	
Content .....	2442.25	Pounds.

## EXAM. 3.

*To find the area of the first section.*

Area  $(124.3 \times 124.3) \div 3601 = 15450.49 \div 3601 = 4.290$  bushels, the area before fermentation;  
 $15450.49 \div 3038 = 5.085$  bushels, the area after fermentation.

*To find the area of the second section.*

Area  $(121.4 \times 121.4) \div 3601 = 14737.96 \div 3601 = 4.109$  bushels, the area before fermentation;  
 $14737.96 \div 3038 = 4.851$  bushels, the area after fermentation.

*To find the area of the third section.*

Area  $(118.3 \times 118.3) \div 3601 = 13994.89 \div 3601 = 3.886$  bushels, the area before fermentation;  
 $13994.89 \div 3038 = 4.606$  bushels, the area after fermentation.

*To find the area of the fourth section.*

Area  $(115.5 \times 115.5) \div 3601 = 13340.25 \div 3601 = 3.704$  bushels, the area before fermentation; and  
 $13340.25 \div 3038 = 4.391$  bushels, the area after fermentation.

*To find the area of the fifth section.*

Here  $(112.6 \times 112.6) \div 3601 = 12678.76 \div 3601$   
 $= 3.520$  bushels, the area before fermentation; and  
 $12678.76 \div 3038 = 4.173$  bushels, the area after fermentation.

Note.—From the dimensions given in the question, and the area of the different sections, found as above, we form the following Dimension Book.

### DIMENSION BOOK.

<i>A. B.'s Starch Vat, No. 2, gauged Feb. 18, 1892.</i>				
Divisions in Inches.	Depths from the Bottom.	Mean Diameters.	Areas in Bushels.	
			Before Fer- mentation.	After Fer- mentation.
12	46	112.6	3.520	4.173
10	35	115.5	3.704	4.391
10	25	118.3	3.886	4.606
10	15	121.4	4.109	4.851
10	5	124.3	4.290	5.085

PROBLEM III.

To gauge and fix a water-frame, in the form of a parallelopipedon.

EXAM. 1.

A TABLE,

showing the Method of Tabulating the Water-Frame, given in this Example.

Dry Inches.	Contents in Green Starch Pounds.	Dry Inches.	Contents in Green Starch Pounds.
12	3976.740 198.837	22	1988.370 198.837
13	3777.903 198.837	23	1789.533 198.837
14	3579.066 198.837	24	1590.696 198.837
15	3380.229 198.837	25	1391.859 198.837
16	3181.392 198.837	26	1193.022 198.837
17	2982.555 198.837	27	994.185 198.837
18	2783.718 198.837	28	795.348 198.837
19	2584.881 198.837	29	596.511 198.837
20	2386.044 198.837	30	397.674 198.837
21	2187.207 198.837	31	198.837 198.837
22	1988.370	32	000.000

## EXAM. 2.

*Inches.*  
 32.0 whole depth.  
 16.6 dry inches.  
15.4 wet inches.  
15.4

Then 198.837, the area in pounds, being multiplied by 15.4, the wet inches, we obtain 3062.0898 pounds the content required.

## PROBLEM IV.

*To gauge and fix a starch-box in the form of a parallelopipedon.*

## EXAM. 2.

*Pounds.*  
 23.3 3 area.  
 5.4 depth.  
93 3 2  
 116 6 5  
125.9 82 content.  
125.9 82

## EXAM. 3.

*To find the area and content with the slide.*

*Inches.*  
 64.4 length.  
 11.6 breadth.  
386 4  
 644

Divisor 34.8) 747.04 (21.46 lb. area.

And  $21.46 \times 6.3 = 135.198$ , the content in pounds.

*To find the area and content without the slide.*

*Inches.*

64.4 length.

12.2 breadth.

1228

1228

644

Divisor 34.8) 785.68 (22.57 lbs. area.

And  $22.57 \times 6.3 = 142.191$ , the content in pounds.

## GLASS GAUGING.

### PROBLEM I.

*To find the area and content of any circular pot, used in making glass.*

EXAM. 2.

*To find the area.*

*Inches.*

36.4 diameter.

86.4 ditto.

145 6

2184

1092

Divisor 13.39) 1324.96 (98.95 lb. the area in crown glass.

Also,  $1324.96 \div 12.96 = 102.23$  lbs. the area in bottle glass.

A a

*To find the content.*

Here  $98.95 \times 39.8 = 3938.210$ , the content in pounds of crown glass; and  $102.23 \times 39.8 = 4068.754$ , the content in Pounds of bottle glass.

### EXAM. 3.

*To find the area.*

*Inches.*

38.7 diameter.

38.7 ditto.

$$\begin{array}{r} 2709 \\ 3096 \\ 1161 \end{array}$$

Divisor 14.32)1497.69(104.15 lbs. the area in British plate glass.

Also,  $1497.69 \div 14.32 = 104.58$  lbs. the area in German sheet glass.

*To find the content.*

Here  $104.15 \times 39.8 = 4145.170$ , the content in pounds of British plate glass; and  $104.58 \times 39.8 = 4162.284$ , the content in pounds of German sheet glass.

## PROBLEM II.

To gauge and fix a pot in the form of a cylinder or the frustum of a cone as practised in the Exercise.

## EXAM. 1.

## A TABLE

showing the Method of inching the Pot given in this Example.

6	4	225		13	2	113		20	0	000	

## EXAM. 2.

*First section and division.*

Here  $36.1 \times 36.1 = 1303.21$ , the square of the diameter; and  $1303.21 \div 12.96 = 100.55$ , the gross area. One-fifth of this area is  $= 20.11$ ; then  $100.55 - 20.11 = 80.44$ , the net area of the section; and  $80.44 \times 6 = 482.64$  pounds, the net content of the division.

*Second section and division.*

Here  $32.3 \times 32.3 = 1043.29$ , the square of the diameter; and  $1043.29 \div 12.96 = 80.50$ , the gross area. One-fifth of this area is  $= 16.10$ ; then  $80.50 - 16.10 = 64.40$ , the net area of the section; and  $64.40 \times 10 = 644.00$  pounds, the net content of the division.

*Third section and division.*

Here  $29.5 \times 29.5 = 870.25$ , the square of the diameter; and  $870.25 \div 12.96 = 67.14$ , the gross area. One-fifth of this area is  $= 13.42$ ; then  $67.14 - 13.42 = 53.72$ , the net area of the section; and  $53.72 \times 10 = 537.2$ , the net area of the section; and  $53.72 \times 10 = 537.20$  pounds, the net content of the division.

*Fourth section and division.*

Here  $25.5 \times 25.5 = 650.25$ , the square of the diameter; and  $650.25 \div 12.96 = 50.17$ , the gross area. One-fifth of this area is  $= 10.03$ ; then  $50.17 - 10.03 = 40.14$ , the net area of the section; and  $40.14 \times 7 = 2809.8$  pounds, the net content of the division.

Note.—The net area of the last section is multiplied by 7, in order to make an allowance of 3 inches at the bottom of the vessel.

*Areas and contents collected and reduced into hundred weights, quarters, and pounds.*

Net Areas of the Sections in					Net Contents of the Divisions in

	4	3	12.39		4	1	12.32				

## PROBLEM II.

*To find the area and content of a cylindrical vessel, in Irish malt bushels, and liquid gallons.*

## EXAM. 2.

Here  $82.4 \times 82.4 = 6789.76$ , the square of the diameter; and  $6789.76 \div 2773.1 = 2.448$ , the area in Irish malt bushels; also,  $6789.76 \div 277.05 = 24.507$ , the area in Irish liquid gallons; then  $2.448 \times 52.6 = 128.7648$ , the content of the vessel, in Irish malt bushels; and  $24.507 \times 52.6 = 1289.0682$ , the content in Irish liquid gallons.

## PROBLEM III.

*To reduce Irish measure to English measure.*

## EXAM. 3.

Here  $1,0128 \times 2685 = 2719.368$ , English malt bushels.

## EXAM. 4.

Here  $.9419 \times 2864 = 2697.6016$ , English wine gallons.

## EXAM. 5.

Here  $56 \times 32 = 1792$ , the number of gallons, according to the gauge in Ireland; and  $.7716 \times 1792 = 1382.7072$ , the number of English ale gallons; then,  $1382.7 \div 36 = 38$  barrels, 14.7 gallons, the answer required.

## PROBLEM IV.

*F: reduce English measure to Irish measure.*

## EXAM. 2.

Exam 1.  $1.3929 \times 2685 = 3479.4915$  gallons, Irish measure.

## EXAM. 3.

Exam 1.  $1.8675 \times 3694 = 3857.491$  gallons, Irish measure.

## SPECIFIC GRAVITY.

## PROBLEM I.

*F: find the magnitude of a body from its weight.*

## EXAM. 2.

lb.	oz.
186	12 gross weight.
45	9 tare of the cask.
<u>141</u>	3 neat weight of the spirits.

2	lb.	oz.	cu. in.
3	922	: 141	3 :: 1728
		16	9239
		<u>849</u>	15532
		141	8640
		<u>9239</u>	3456
			3456

Divisor 922)39035.32(4233 cubic inches.

And  $4233 \div 231 = 18.32$ , the content in wine gallons.

## EXAM. 3.

$\begin{array}{ccccc} \text{oz.} & \text{lb.} & \text{oz.} & \text{cu. in.} & \text{cu. in.} \\ \text{As } 1063 : 58, 19 :: 1728 : 1524, & \text{the content} \\ \text{required.} \end{array}$

## EXAM. 4.

$\begin{array}{ccccc} \text{oz.} & \text{lb.} & \text{oz.} & \text{cu. in.} & \text{cu. in.} \\ \text{As } 925 : 569 :: 1728 : 1690, & \text{the content re-} \\ \text{quired.} \end{array}$

## PROBLEM II.

*To find the weight of a body from its magnitude.*

## EXAM. 2.

$\begin{array}{ccccc} \text{cu. in.} & \text{gal.} & \text{cu. in.} & \text{oz.} & \text{oz.} \\ 1728 : 36 \times 282 :: 1034 : 6074 = 3 \text{ cwt.} \\ \text{r. } 15 \text{ lb. } 10 \text{ oz. the weight required.} \end{array}$

## EXAM. 3.

Here  $12 \times 12 \times 63 = 144 \times 63 = 9072$  cubic feet,  
 solidity of the stone; then, as  $1 \text{ ft.} : 9072 \text{ ft.} :: 2700$   
 $24494400 \text{ oz.}$ ; and  $24494400 \div 35840 = 683.4375$   
 which is nearly equal to the burthen of an East  
 ship.

*The Method of Estimating*  
**THE TONNAGE OF SHIPS.**

—  
**CASE I.**

*When the vessel is laid dry.*

**EXAM. 2.**

	<i>Feet.</i>
Gross length	108.75 of the keel.
$29.5 \times \frac{2}{3} =$	17.70 the deduction.
True length	91.05 difference.
	29.5 breadth of the beam.
	45525
	81945
	18210
	2685.975 first product.
	14.75 half the breadth.
	134298 75
	1880182 5
	10749900
	2685975
	39618.13125 second product.

Then  $39618.13125 \div 94 = 421.46948$  tons, the burthen required.

**CASE II.**

*When the vessel is afloat.*

**EXAMPLE.**

Here  $150.75 \times 50.5 \times 25.25 = 7612.875 \times 25.25$   
 $192225.09375$ ; and  $192225.09375 \div 94 = 2044.9478$   
 tons, the burthen required.

**RULES FOR REDUCING SPIRITS OF ANY GIVEN  
STRENGTH, TO ANY REQUIRED STRENGTH.**

**PRELIMINARY OBSERVATIONS.**

By Act of Parliament all spirits imported from Ireland or Scotland into England, of different strengths and different quantities, are reduced to seven per cent. over hydrometer proof.

It is also enacted that all spirits made in Ireland, and exported from thence into England, at a strength exceeding 25 per cent. above proof, are seizable, and any spirits made in England or Scotland, and exported from thence into Ireland exceeding the above strength are also seizable.

No foreign spirits shall be imported and warehoused, or exported in any boat less than 70 tons burthen, in any cask of less than 100 gallons; unless it appears to be occasioned from the leakage of a cask or other accident, and without intention of fraud.

On the landing of such spirits, it must be reduced 7 per cent. over proof, but it shall not be forfeited for any excess or deficiency of strength of any such spirits being not more than 3 per cent. above or below the strength of such spirits specified in the permit.

British plantation rum may be imported and warehoused in casks of 60 gallons, or upwards.

Foreign wine not to be imported and warehoused in casks less than 45 gallons each, or in vessels less than 60 tons burden.

All British spirits of a greater strength than 43 per cent. above proof by Sykes's Hydrometer, shall be deemed spirits of wine.

Spirits manufactured and imported from Scotland or England, of a greater strength than 7 per cent. above proof, and not exceeding 10 per cent. above proof, shall not be forfeited, but be charged with a further duty proportioned to their surplus strength.

It would be quite superfluous to treat upon the use

and description of the Hydrometer here, as there is always a proper book of instructions given with the instrument.

1. To calculate any given quantity of proof spirits in any other given quantity, either above, or below Hydrometer proof.

### RULE I.

*When the spirits are above proof.*

Multiply the given quantity by the rate per cent. above proof, divide the product by 100, add the quotient to the given quantity, and the sum will be the quantity of proof spirits required.

### RULE II.

*When the spirits are under proof.*

Multiply the given quantity by the rate per cent. under proof, divide the product by 100, subtract the quotient from the given quantity, and the remainder will be the quantity of proof spirits required.

### EXAMPLES.

1. If a puncheon of rum contain 124 gallons, at the strength of 15 per cent. over hydrometer proof, how many gallons of proof spirits does it contain.

$$\begin{array}{r}
 124 \text{ gauged quantity.} \\
 15 \text{ rate per cent.} \\
 \hline
 620 \\
 124 \\
 \hline
 \text{Divisor } 100) 1860 \\
 \hline
 18.6 \text{ gallons over proof.} \\
 124 \text{ gauged quantity.} \\
 \hline
 \underline{\underline{142.6}} \text{ proof spirits required.}
 \end{array}$$

2 How many gallons of proof spirits does the foregoing puncheon contain, at the strength of 15 per cent. under proof.

$$\begin{array}{r}
 124 \text{ gauged quantity.} \\
 15 \text{ rate per cent.} \\
 \hline
 620 \\
 124 \\
 \hline
 \text{Divisor } 100) \overline{1860} \\
 \underline{18.6} \text{ gallons under proof.}
 \end{array}$$

Then  $124 - 18.6 = 105.4$  gallons of proof spirits.

3. Admit a cask of spirits to contain 132 gallons, at the strength of 20.5 per cent. over proof, required the number of gallons when reduced to proof spirits.

Here,  $(132 \times 20.5) \div 100 = 2706 \div 100 = 27.06$  gallons above proof, then  $132 + 27.06 = 159.06$  gallons of proof spirits required.

*Note.*—Proof spirits may be reduced to either above or below proof, by the preceding rules.

*To reduce spirits of any given strength above 7 per cent. O. P., to the strength of 7 per cent. above Hydrometer proof.*

### RULE.

As 107 is to 100 with the given rate per cent., so the given quantity, to the quantity required.

### EXAMPLE.

A merchant imports 21010 gallons of spirits, at the strength of 20.5 per cent. above proof; how many gallons when reduced to 7 per cent. above proof.

As  $107 : 120.5 :: 21010 : 23660.79$  gallons of proof spirits required.

3. To calculate whether the produce of any distillation exceeds the Distiller's credit of 19 gallons of spirits at 8 per cent. above proof, to 100 gallons of wort or wash distilled.

### RULE.

Reduce the whole quantity distilled, at different degrees of strength, to 8 per cent. above proof, divide the number of gallons of wash by 100, multiply the quotient by 19, and the product will be the number of gallons he is allowed to make, the difference between the quantity reduced to 8 per cent. above proof and the last number will be the excess or defect.

### EXAMPLE.

Suppose a distiller made 2200 gallons of spirits at 8.5 per cent. O. P., 1300 gallons at 7 per cent. O. P., and 600 gallons of feints at 68 per cent. U. P.; from 18000 gallons of wash, required the excess or defect of his quantity allowed by act of Parliament.

$$2200 \times 108.5 = 238700$$

$$1300 \times 107 = 139100$$

$$600 \times 32 = 19200$$

Divisor 108)397000(3675.92 gallons,  
made at 8 per cent. O. P.

Then  $\frac{18000}{100} \times 19 = 180 \times 19 = 3420$  gallons,  
his wort is allowed to make ;

And  $3675.92 - 3420 = 255.92$  gallons above his credit, which must be charged with 9s. 2½d. per gallon, in addition to all other duties. (See the following note.)

*Note.*—If any distiller of spirits in England, shall in the year ending on the 5th of July, in every year, make or produce from wort or wash made from malt, corn, grain, or tilts, or any mixture therewith, any quantity of spirits exceeding upon the average of his work in such year, the proportion of 19 gallons of spirits at

the strength of 8 per cent. above proof, for every 100 gallons of wort, or wash so distilled, he shall, in lieu of any penalty for the excess, pay duty for all spirits exceeding the proportion upon such average, after the rate of 9s. 2½d. for every gallon of such excess, over and above all other duties.

#### 4. *To estimate a Rectifier's stock.*

##### RULE.

Reduce the whole of his stock at different degrees of strength (spirits of wine excepted) to 7 per cent. O. P., increase his stock at that strength by one-half thereof, also by twice the number of gallons of spirits of wine, and the sum will be the quantity of spirits for the rectifier's credit.

##### EXAMPLE.

A rectifier has 300 gallons of spirits at 7.5 per cent. O. P., 410 gallons at 15 per cent. O. P., 900 gallons at 25 per cent. O. P.; and 200 gallons of spirits of wine; what is his credit?

$$\begin{array}{rcl}
 \text{Here } 300 \times 107.5 & = & 32250 \\
 410 \times 115 & = & 47150 \\
 900 \times 125 & = & 112500 \\
 \text{Divisor } 107)191900 & (1793.45 & \text{gallons at 7} \\
 & & 896.72 \text{ one-half,} \\
 & & 200 \times 2 = 400 \text{ spirits of wine.} \\
 \text{His credit } & \underline{3090.17} & \text{gallons.}
 \end{array}$$

*Note.*—Any surplus found on balancing a rectifier's stock, is reduced to 7 per cent. above proof, by multiplying the given quantity by 2, and dividing the product by 3.

# DUTIES.

*A Concise List of the DUTIES, ALLOWANCES, DRAWBACKS, and LICENCES, payable on different Articles of the Growth, Produce, or Manufacture of GREAT BRITAIN or IRELAND.*

## ACTIONS.

For every hundred shillings of the purchase-money, payable to the owner of any mine or section, for the growth or the increase of any sheep or lamb's wool, the growth or produce of any part of the United Kingdom	£ 1 1
For every hundred shillings of the purchase-money, payable to the owner of any mine or section of estates, minerals, woods and wastes, interest in the public	0 0 1
For every hundred shillings of the purchase-money, payable to the owner of any mine or section of furniture, articles, houses, lands, houses, and carriages, and all other goods and chattels whatsoever, excepting	0 1 3

For more particulars in the exemption of duty, see Huie's Excise

## BEER.

For every barrel of strong beer or ale, not being two-hundred and above sixteen shillings the barrel, brewed by any common brewer, victualler, or other person who shall sell or tap out beer or ale	0 10 0
For every barrel of table beer of sixteen shillings the barrel, brewed by any common brewer or other person who shall sell or tap out beer or ale	0 2 3
For every barrel containing of thirty-six gallons of two-hundred and above in the seventh article of the Treaty of Commerce with Scotland	0 4 1
For every barrel containing thirty-six gallons, English beer brewed in Great Britain, or ale, or mum, imported from Great Britain from Ireland	0 16 1
For every barrel containing thirty-two gallons, wine measure, of spruce beer, and all other kinds of beer, or ale, and all every such barrel of mum, imported from Great Britain into Great Britain, not being Great Britain, ale, or mum, imported from Ireland	2 0 0

2] DUTIES.—*Bricks and Tiles—Candles—Coffee.*

By an act of 43 G. 3, c. 69, every common brewer is allowed 3 barrels in every 36, or  $\frac{1}{12}$  part; whence 10s. —  $\frac{1}{12}$  = 9s. 10d. the duty which must be charged upon every barrel of strong beer or ale; the same may be observed with table beer.

BRICKS AND TILES.

For every thousand of bricks, not exceeding any of the following dimensions, that is to say, ten inches long, 3 inches thick, and five inches wide .....	£. s. d.
	0 5 10
For every thousand of bricks, exceeding any of the foregoing dimensions ....	0 10 0
For every thousand of bricks, smoothed or polished, not exceeding ten inches long, three inches thick, and five inches wide .....	0 12 10
For every hundred of bricks, smoothed or polished, exceeding any of the foregoing dimensions .....	0 2 5
For every thousand of plain tiles .....	0 5 8
For every thousand of pan or ridge tiles .....	0 12 10
For every hundred of paving tiles, not exceeding ten inches square .....	0 2 5
For every hundred of paving tiles, exceeding ten inches square .....	0 4 10
For every thousand tiles, other than such as are before enumerated or described .....	0 4 10

All Irish bricks and tiles of the above denomination, imported into Great Britain from Ireland, are subject to the same duties.

CANDLES.

For every pound weight of tallow candles, and other candles whatsoever, except wax and spermaceti candles .....	0 0 1
For every pound weight of wax or spermaceti candles .....	0 0 3 $\frac{1}{4}$

All Irish candles imported into Great Britain from Ireland, are subject to the same duties.

For the method of charging the duties on exciseable commodities by the pound weight avoirdupois, see the remark, page 78. Table 12, in the Gauging.

COFFEE.

For every pound weight of coffee or cocoa nuts, the produce of any British colony or plantation in America, or the West Indies in Africa, imported into Great Britain .....	0 1 0
For every pound weight of coffee, or cocoa nuts, imported into Great Britain by the East India Company ....	0 1 6
For every pound weight of all other coffee or cocoa nuts, imported into Great Britain .....	0 2 6

## DUTIES.—*Hides and Skins.*

	£.	s.	d.
or every hundred weight of all other Irish window glass, not being spread glass, whether flashed or otherwise manufactured, and commonly called crown glass or German sheet glass .....	3	13	6
or every dozen of reputed quart bottles of common green glass .....	0	1	6
or every hundred weight of vessels made use of in chemical laboratories, and of garden glasses, and of all other vessels or utensils of common bottle metal, manufactured in Ireland, common bottles excepted .....	0	4	0½
For every hundred weight of any sort or species of Irish glass, not herein before enumerated or described .....	3	3	0
For every hundred weight of plate glass and all other glass manufactures, imported from beyond the seas, not being flasks in which wine or oil shall or may be imported, nor foreign green glass bottles, nor Irish glass or glass manufactures .....	6	6	0

## HIDES AND SKINS TANNED.

For every pound weight of hides of what kind soever, and of calve skins, kips, hog skins, dogs skins, and seal skins, which shall be tanned, and of sheep skins and lamb skins, which shall be tanned for gloves and bazils .....	0	0	1½
For every dozen of goat skins tanned with shomack, or otherwise, to resemble Spanish leather .....	0	4	0
For every dozen of sheep skins tanned for roans, being after the nature of Spanish leather .....	0	2	3
For every pound weight of all other skins, and of all parts and pieces of hides and skins, not herein before enumerated .....	0	0	6

## TAWED.

For all hides of horses, mares, and geldings, which shall be dressed in alum and salt, or meal, or otherwise tawed; for every such hide .....	0	1	6
For all hides of steers, cows, or any other hides of what kind soever, those of horses, mares, and geldings excepted; for every such hide .....	0	3	0
For every pound weight of all calve skins, kips, and seal skins .....	0	0	1½
For every dozen of slink calve skins, dressed or tawed with the hair on .....	0	3	0

# Dresses.—Hides and Skins.—Hops.

[5

	£	s	d
For every stone of skin other skins, dressed or tanned without salt, and for every dozen of dogs skins, and a cat skin, tanned or dressed .....	0	1	0
For every pound weight of buck and doe skins .....	0	0	6
For every stone of goat skins and of beaver skins .....	0	2	0
For every pound weight of sheep and lamb skins .....	0	0	1½
For every pound weight of all other skins, and of all sorts and pieces of hides and skins which shall be so dressed or tanned, not herein before enumerated ..	0	0	6

## DRESSED IN OIL.

For every pound weight of all buck, doe, and cat skins dressed in oil .....	0	1	0
For every pound weight of all sheep and lamb skins .....	0	0	3
For every pound weight of all other skins, and of all sorts, and parts and pieces of hides and skins which shall be dressed in oil .....	0	0	6
For every dozen of vellum .....	0	3	6
For every stone of parchment .....	0	1	9

Hides and skins tanned, tressed, or dressed in oil, in Ireland, and imported from thence into Great Britain, unmanufactured, are subject to the same duties.

## Imported from Ireland, manufactured.

For every dozen of Irish vellum .....	0	3	6
For every stone of Irish parchment .....	0	1	9
For every pound weight of tanned leather, manufactured and actually made into goods and wares in Ireland .....	0	0	1½
For every pound weight of Irish made boots and shoes, and gloves and other manufactures, made of tanned or dressed leather .....	0	0	1
For every pound weight of all buck, doe, and cat skins, dressed in oil, and manufactured into goods and wares in Ireland .....	0	2	0
For every pound weight of all sheep and lamb skins, dressed in oil, and manufactured into goods or wares in Ireland .....	0	0	3

## HOPS.

For every pound weight, of hops .....	0	0	2
For every pound weight, of Irish hops, imported from Ireland into Great Britain .....	0	0	2

## 6] DUTIES.—*Malt—Mead or Metheglin—Paper.*

### MALT.

	£.	s.	d.
For every bushel of malt which shall be made in England from barley, or any other corn or grain .....	0	2	6
For every bushel of malt made in Scotland from barley or any other corn or grain .....	0	2	6
For every bushel of malt which shall be brought from Scotland into England without a certificate .....	0	2	6
For every bushel of malt unground, made in Ireland, and imported into England .....	0	3	6

### MEAD OR METHEGLIN.

For every gallon of mead or metheglin, which shall be made for sale .....	0	4	6
For every gallon of mead or metheglin imported into Great Britain, not being Irish metheglin or mead, imported from Ireland .....	0	5	0
For every gallon of metheglin or mead imported from Ireland .....	0	1	6

### PAPER.

For every pound weight, of paper of the first class or denomination, that is to say, all paper other than brown paper made of old ropes or cordage only, without separating or extracting the pitch or tar, or any part therefrom, and not being glazed paper for clothiers and hot presses, or sheathing paper, or button-paper, or button-board .....	0	0	3
For every pound weight, of paper of the second class or denomination, that is to say, all brown paper made of old ropes or cordage only, as before specified .....	0	0	1½
For every hundred weight of glazed paper for clothiers and hot-pressers, and of mill-boards and scale-boards .....	1	1	0
For every hundred weight of sheathing paper, button-paper, and button-board .....	1	1	0
For every hundred weight of paste-board made from paper wholly of the second class .....	0	14	0
For every hundred weight of paste board made wholly or in part from paper, mill-board, button-board, button-paper, glazed paper, or sheathing paper, other than paper of the second class or denomination .....	1	8	0

All glazed, or other paper couched, or pressed together, without the use of paste, with any sheet of paper of the same or any other class materials, is deemed subject, and liable, to the same duty as the first class paper.

## DUTIES.—*Printed Goods—Pepper—Salt.* [7

Irish paper of all the above denominations, imported into Great Britain from Ireland, are subject to the same duties.

For every pound weight of books whether bound or unbound, and of maps, or prints imported into Great Britain from Ireland .....	£. s. d. 0 0 3
---	-------------------

### PRINTED GOODS.

For every yard square of paper which shall be printed, painted, or stained to serve for hangings or other uses	0 0 1
For every yard square of Irish printed, painted, or stained papers, to serve for hangings or other uses imported into Great Britain from Ireland .....	0 0 3
For every yard in length, reckoning yard wide, of foreign calico, and of foreign muslin, printed, stained, painted, or dyed, except such as shall be dyed throughout of one colour only .....	0 0 7
For every yard in length, reckoning yard wide, of all linens, and of stuffs wholly made of cotton wool, commonly called British manufactory, and of British muslins, and of all fustians, velvets, velverets, dimities, and other figured stuffs, made of cotton and other materials mixed, or wholly made of cotton wool wove in Great Britain, and of all other stuffs whatsoever, which shall be printed, stained, painted, or dyed, except such as shall be dyed throughout of one colour only, and stuffs made of woollen, or whereof the greatest part in value shall be woollen ..	0 0 1
For every yard square of silks of whatsoever kind, printed, painted, stained, or dyed, except such as shall be dyed throughout of one colour only .....	0 0

Irish printed goods imported into Great Britain from Ireland subject to the same duties.

All calicoes printed, painted, or stained, shall pay as yard if within, or not exceeding, one-eighth of a yard.

All ribbands and silks, printed, painted, or stained, though less than half a yard in breadth, are declared to be within the same duties.

### PEPPER.

For every pound weight of all pepper, not being cayenne, long pepper, or Guinea pepper .....	0 0
--	-----

### SALT.

For every bushel of salt, or rock salt, made at any salt work in England .....	0 0
--	-----

## 1] DUTIES.—*Soap—British Spirits.*

Sixty-five pounds weight of rock salt shall be deemed a bushel of rock salt; and of every other kind of salt, not being rock salt, fifty-six pounds weight shall be deemed a bushel.

	£.	s.	d.
or every ton of all mineral alkali called soda .....	1	10	0
or every bushel of foreign salt imported into Great Britain, not being Irish salt imported from Ireland	0	2	3
or every bushel of rock salt imported from Ireland into Great Britain, or from Scotland into England ...	0	2	0
or every bushel of coarse and impure rock salt delivered from any salt pit, mine, or warehouse, in lumps of not less than 20 lbs. weight, for the purpose of feeding, or mixing with the food of sheep and cattle, or steeping seed, or preserving hay, or being employed as manure for land .....	0	0	6
or every bushel of rock salt exported to parts beyond the seas, other than Ireland ..	0	0	1
or every hundred weight of salted beef, or pork or bacon, or other flesh brought from Scotland to England .....	0	0	6

## SOAP.

every pound weight of hard cake soap, or ball soap .....	0	0	3
every pound weight of soft soap .....	0	0	1½

## BRITISH SPIRITS.

every gallon of wort or wash, brewed or made from any malt, corn, grain, or tilts, or any mixture therewith, for extracting spirits in England for home consumption .....	0	2	0
every gallon of cyder, or perry, or any sort of British materials, except such as are before mentioned .....	0	1	3
every gallon of wort or wash brewed from melasses or sugar, or any mixture therewith, for extracting spirits for home consumption .....	0	2	6
every gallon of foreign refused wine, or cyder or any other foreign materials, except melasses and sugar	0	3	6
every gallon of spirits extracted in England for home consumption, by any distiller from any wort or wash, whereof the duty of two shillings for every gallon shall not have been charged and paid, computed at the strength of seven per centum above proof ..	0	1	3½

For every gallon of spirits extracted in England for home consumption, from any wort or wash, made from melasses or sugar, or any mixture therewith, over and above the proportion of twenty one gallons of such spirits, the whole being computed at 8 per centum above hydrometer proof, for every 100 gallons of such wort or wash so distilled into spirits	£. s. d.
	0 11 0

### MAIDSTONE DISTILLERY.

For every 120 gallons of wash produced by Sir William Bishop and George Bishop, at Maidstone, from a weight of malt or other grain including the bran, and not exceeding 112 pounds .....	2 17 4
For every gallon of wash in the possession of the said Sir William and George Bishop at any time when 30 gallons of any wash, so in their possession, shall be found to produce more than $2\frac{1}{2}$ gallons of spirits at the strength of 1 in 6 under hydrometer proof ...	0 1 11

### *Imported into Scotland from England.*

For every gallon of spirits extracted in England and imported into Scotland, of a strength not exceeding seven per centum above hydrometer proof, and so in proportion of any higher degree of strength, not exceeding the strength of ten per cent. above hydrometer proof .....	0 4 9½
---	--------

### *Imported into England from Scotland.*

For every gallon of spirits extracted in Scotland, and imported from thence into England, of a strength not exceeding seven per cent. above hydrometer proof, and so in proportion for any higher degree of strength not exceeding ten per cent. above hydrometer proof .....	0 10 6
For every gallon of wort or wash brewed or made from malt, corn, grain, or tilts, or any mixture therewith, for extracting spirits for home consumption in Scotland .....	0 0 7½
For every gallon of cyder or perry, or any other liquor, made from any sort of British materials, except such as before-mentioned .....	0 0 9
For every gallon of wort or wash made from melasses, or sugar, or any mixture therewith, for extracting spirits for consumption in Scotland .....	0 0 9
For every gallon of wash made from foreign refused wine or foreign cyder, or any other foreign materials, except melasses and sugar .....	0 0 9

for every gallon of spirits of the strength of seven per centum above proof, made from malt, corn, grain, or tilts, or any mixture therewith, for extracting spirits for home consumption .....	£. s. d.
	0 0 8½
for every gallon of spirits of the strength of one to ten over hydrometer proof, made from cyder, or perry, or any other liquor made from any sort of British materials, or any mixture therewith, for consumption in Scotland .....	0 2 1½
for every gallon of spirits of the strength aforesaid, made from melasses or sugar, or any mixture therewith, for consumption in Scotland .....	0 5 7½
for every gallon of spirits of the strength aforesaid, made from foreign or refused wine, or foreign cyder or wash, or wash prepared from any other foreign materials, for consumption in Scotland ....	0 6 9

*Irish Spirits imported into Great Britain.*

for every gallon of spirits extracted in Ireland, and imported from thence into England, at a strength not exceeding seven per centum above hydrometer proof, and so in proportion for any greater degree of strength not exceeding twenty one per centum above hydrometer proof .....	0 11 0
for every gallon of spirits extracted in Ireland, and imported from thence into Scotland, at a strength not exceeding seven per centum above hydrometer proof, and so in proportion for any greater degree of strength not exceeding twenty-one per centum above hydrometer proof .....	0 5 3½
for every gallon of spirits extracted in Ireland, and imported from thence into Scotland, and from Scotland into England, at a strength not exceeding seven per centum above hydrometer proof .....	0 4 6

*Foreign Spirits imported into Great Britain.*

for every gallon of single rum, spirits, or aqua vitæ, the produce of the British colonies in America .....	0 10 4½
for every gallon of rum, spirits, or aqua vitæ, above proof, the produce of the British colonies in America .....	1 0 0
for every gallon of single rum, spirits, or aqua vitæ, imported by the East India Company .....	0 15 5½
for every gallon of rum, spirits, or aqua vitæ above proof, imported by the East India Company .....	1 7 3½
for every gallon of single brandy, spirits, aquæ vitæ, strong waters of any kind, other than such rum, spirits, or aqua vitæ as aforesaid, not being Irish spirits imported from Ireland .....	0 17 0½

## DUTIES.—*Starch—Stone Bottles, &c.* [11

£. s. d.

For every gallon of brandy, spirits, aqua vitæ or strong waters, above proof other than such brandy, rum, spirits, or aqua vitæ as aforesaid, imported into Great Britain, not being Irish spirits imported from Ireland .....	}	1 10 6½
--	---	---------

### STARCH.

For every pound weight of starch of what kind soever, made in Great Britain .....	}	0 0 ¾
For every pound weight of Irish starch, or hair powder, imported from Ireland into Great Britain .....	}	0 0 ¾

### STONE BOTTLES.

For every hundred weight of stone bottles, not exceeding two quarts measure, made in Great Britain ....	}	0 5 0
For every hundred weight of stone bottles, not exceeding two quarts measure, made in Ireland, and imported from thence into Great Britain .....	}	0 5 0
For every hundred weight of stone bottles, not exceeding two quarts measure, imported from any other place .....	}	0 5 0

### SWEETS.

For every barrel of liquor made for sale, by infusion, fermentation, or otherwise, from fruit or sugar, or from fruit or sugar mixed with any other ingredients or materials, commonly called sweets, or made wines .....	}	2 9 0
For every barrel consisting of thirty-one gallons and a half English wine measure, of Irish sweets or other Irish liquor, made as aforesaid, commonly called sweets or made wines, imported from Ireland into Great Britain .....	}	2 9 0

### TEA.

For all tea sold by the East India company, at or under two shillings per pound weight, to be computed upon the gross prices at which such tea shall be sold .....	}	96 0 0 per centum
For all tea sold by the East India company above two shillings per pound weight to be computed in like manner. ....	}	100 0 0 per centum

**TOBACCO.**

	£.	s.	d.

The Act of Geo. IV. chap. 30, repeals the countervailing duties upon commodities imported from Ireland into Great Britain, and exported from Great Britain into Ireland, but did not appear before the foregoing tables were struck off the press.

1. All articles liable to equal duties of Excise, in Great Britain and Ireland, may be imported without duty, and exported without drawback, between the two countries.

2. Articles imported, and liable to the highest rate of duty in the importing country, shall pay only the excess of duty.

3. Articles exported, and liable to the highest rate of duty in the exporting country, shall be allowed a drawback in the excess of duty only.

4. Articles liable to duty in the exporting country, shall pay the whole duty on import, and no drawback shall be allowed on export.

5. Articles liable to duty in the exporting country, and not in the importing country, shall receive the whole drawback on exportation, and shall not be liable to duty on importation.

6. Articles liable to duty, but warehoused duty free, may be exported from warehouses in one country, and shall be liable to duty on import into the other.

## EXCISE LICENCES.

## ERRATA.

Page 6. Exam. 12.

Here  $\frac{10 \times 22 \times 36}{18 \times 25 \times 48} = \frac{12672}{21600}$ , the equivalent fraction; then,  
 $12672 \div 21600 = .5866$ , Ans.

Page 80. Exam. 6.

For 12303, read 123093; and for 32.646, read 32.425.

Page 83. Exam. 4.

Here  $96.8 \times 96.8 \times 84.6 = 9370.24 \times 84.6 = 792722.304$ ;  
and  $792722.304 \div 2738 = 289.526$ , the content in malt bushels.

Page 94. Prob. XVI. Exam. 2.

For 5385.79, read 5385.75; for 4411.76, read 4411.8; and for  
65.668, read 65.687.

Page 94. Exam. 3.

For 41069.92, read 41070.

Page 222, line 8, for .0023867, read .002366.

5, Exam. 4, for .9929583, read .0029583.

227, 4, Exam. 2, for 0.4375, read .04375; and for  
32.43479375, read 32.43459375.

Page 271. Exam. 2.

Here  $\frac{48 \times 24}{12} = \frac{1152}{12} = 96$  lbs. Ans.

FINIS.

---

*Just Published,*

A TREATISE ON PRACTICAL GAUGING; containing  
Vulgar and Decimal Fractions; Square and Cube Roots; the most  
approved Methods of Drawing Geometrical Figures; Mensuration  
of Superficies and Solids applied to Gauging, in all its Departments;  
the Method of finding the Contents of all the Cylindrical, Pyrami-  
dical, and Conical Ungulas, that can possibly be formed, by placing  
Vessels in various Positions; the Method of Gauging, Ullaging,  
and Inching Casks, as adopted in the Excise; the Process of Gau-  
ging and Ullaging Casks by the Callipers, Bung Rod, and Head  
Rod, as conducted by the Port Gaugers of the Excise and Customs;  
and likewise the Method of Gauging, Fixing, and Inching the  
Utensils of Victuallers, Common Brewers, Maltsters, Distillers,  
Soap-Makers, Starch-Makers, and Glass-Makers, as practised  
by the Officers of the Excise, in the United Kingdom of Great  
Britain and Ireland.—By A. NESBIT, and W. LITTLE, Officer of  
Excise. Dedicated, by permission, to the Hon. Commissioners  
of Excise. In one large volume, 12mo. illustrated by 680 Prac-  
tical Examples, and 180 Wood Cuts; price 8s. bound.

*This Day are Published,*  
By LONGMAN, HURST, REES, ORME, BROWN, and GREEN,  
London; and by WILSON and Sons, York.

I.

*In one handsome Volume, Octavo, price 12s. in boards,*  
A new Edition, greatly enlarged by numerous additions and improvements, and illustrated by two hundred and fifty Practical Examples, one hundred and sixty Wood Cuts, twelve Copper-plates, and an Engraven Field-Book of sixteen pages, of

A COMPLETE TREATISE ON  
*PRACTICAL*  
**LAND-SURVEYING,**  
*IN SEVEN PARTS,*

DESIGNED CHIEFLY FOR THE USE OF SCHOOLS AND  
PRIVATE STUDENTS.

Containing I. Definitions, Problems, and Theorems in Geometry, requisite in Land-Surveying.

II. A Description of the Chain, Cross-Staff, Offset-Staff, Compass, and Field-Book; also Directions and Cautions to Young Surveyors, when in the Field, &c.

III. To Survey with a Chain and Cross; also, to measure Meres, Woods, and Lines upon which there are Impediments.

IV. The Method of Surveying with the Chain only; and of measuring Meres, Woods, Roads, Rivers, Canals, Distances, Lines, upon which there are Impediments, and Hilly Ground.

V. The Method of Surveying and Planning Estates, illustrated by several rough and finished Plans, and an Engraven Field-Book of sixteen pages.

VI. Rules and Directions for laying out any given quantity of Land, in any proposed Figure; for parting from any Field or Figure, any Quantity of Land required; and for dividing a Piece of Land among sundry Claimants, in the Proportion of their respective Claims, or a Common, &c. of variable Value, among any number of Proprietors, in the Proportion of their respective Interests. This is exemplified by a Plan of Three Small Estates, and a Common, which is divided according to its Quality. Also the Method of reducing Statute Measure to Customary, and *vice versa*.

VII. The Method of Measuring and Planning Villages, Towns, and Cities; Directions for Measuring and Planning Building-Ground, and dividing it into convenient Lots for Sale; and Miscellaneous Questions relating to Surveying, Laying-out, Parting-off, and Dividing Land.

By A. NESBIT,  
*Master of the Commercial and Mathematical Academy, Oxford Road, Manchester.*

The whole explained and simplified in such a Manner, as will, with ample Assistance, both in Theory and Practice, be useful in disseminating the knowledge of Geometry; or to those Persons who desire to become Surveyors.

## II.

*In one large Volume, 12mo, price 6s. bound,*

A new Edition, illustrated by five hundred and eighty Practical Examples, two hundred Wood Cuts, three Copper-plates, and an Engraven Field-Book, of

### A TREATISE ON PRACTICAL MENSURATION, IN EIGHT PARTS;

Containing the most approved Methods of Drawing Geometrical Figures; Mensuration of Superficies; Land-Surveying; Mensuration of Solids; the Use of the Carpenter's Rule; Timber Measure, in which is shewn the Method of measuring and valuing standing Timber; Artificers' Work, illustrated by the Dimensions and Contents of a House; Mensuration of Haystacks, Drains, Canals, Marlpits, Ponds, Mill-dams, Embankments, Quarries, and Coal-heaps; Conic Sections and their Solids; and a Dictionary of the Terms used in Architecture.

By A. NESBIT.

## III.

A KEY to the PRACTICAL MENSURATION; containing Solutions to all the Questions which are not answered in that Work; with References to the Problems, Rules, and Notes, by which the Solutions are obtained. The Second Edition, in one volume, 12mo. price 5s. bound.

## IV.

*In one Volume, 18mo, price 2s. 6d. bound,*

A new Edition, greatly improved by numerous Notes, Remarks, and Observations; and by the Addition of two hundred and fifty Examples for Practice, of

AN INTRODUCTION to ENGLISH PARSING,  
forming a KEY to Part I. of MURRAY'S ENGLISH EXERCISES:  
intended for the Use of Schools, and Private Learners.

By A. NESBIT.

"Parsing is an Exercise of great importance to the Pupil; and should be continued regularly through the whole course of his Grammatical Instruction."—*Murray.*
